EXECUTIVE SUMMARY

As part of the Waste Discharge Licence (WDL177-09), NTR is required to complete and provide to the Northern Territory Environmental Protection Agency (NT EPA) a Waste Discharge Licence Annual Monitoring Report. This report documents the Project site's environmental monitoring of the surface waters from 1 July 2020 to 30 June 2021 as per Condition 44 of WDL 177-09.

The Annual Monitoring Report has also been produced in adherence to the requirements set out in Northern Territory Environment Protection Authority Guideline for Reporting on Environmental Monitoring May 2016.

The Project is located 7 km northwest of Batchelor, approximately 105 km by road (Stuart Highway, Batchelor Road and Rum Jungle Road) south of Darwin in the Northern Territory. It is located to the north-east of Litchfield National Park and within the upper catchment of the Finniss River. To the immediate east, and upstream, of the site is the former Rum Jungle Mine, which contains former mine workings including flooded open pits and waste rock dumps/stockpiles.

The treatment process currently involves pumping the poor quality and/or contaminated water into a CCD, a thickener tank within the plant, where it is treated with a lime solution and a flocculent/coagulant. The lime raises the pH of the water which causes the metals to precipitate thereby decreasing bioavailable metal concentrations markedly. Flocculent/coagulants turn the precipitated metals into a sludge which is then thickened and pumped to the TSF. The treated water overflows from the thickener and is directed via the site drainage network to the Main Sediment Dam.

The current surface water management strategy aims at preventing the likelihood of poor quality water entering the Open Pit and Main Sediment Dam. Areas that generate poor quality water are currently isolated with bunds and pumps to facilitate treatment of the water prior to release to the Pre-Settlement Ponds. These ponds capture treated and clean site runoff waters and were constructed in 2011 to decrease flow velocity and increase time for particulates to settle out of the water column before overflowing into the Main Sediment Dam.

Water discharged from the Licensed Discharge Point at Site 5 was compliant with the trigger levels specified in the WDL177-09. It was routinely noted during the months where discharge occurred that water quality in the East Finniss River measured at Site GS200 and Site 1 was of substantially poor quality compared to water discharged from Site 5. There are no discernible trends evident from the monitoring data since 2018 apart from seasonal effects.

A large salt water crocodile took up residence in close proximity to GS200/Site 1 during March and April 2021. Sampling at GS200/Site 1 was suspended for safety reasons. NT Government Rangers subsequently set traps and caught/removed a 3 m crocodile in April 2021. Sampling at Site 1/GS200 resumed in May 2021.

1. INTRODUCTION

As part of the Waste Discharge Licence (WDL177-09), NTR is required to complete and provide to the Northern Territory Environmental Protection Agency (NT EPA) a Waste Discharge Licence Annual Monitoring Report. This report documents the Project site's environmental monitoring of the surface waters from 1 July 2020 to 30 June 2021.

The Report has also been produced in adherence to the requirements set out in Northern Territory Environment Protection Authority Guideline for Reporting on Environmental Monitoring May 2016.

Figure 1: Location of project area

2. MONITORING OBJECTIVE

The objective of the water quality monitoring undertaken is to ensure compliance with Waste Discharge License (WDL) 177-09 that was granted on 21 December 2020. Prior to that date, NTR operated in accordance with WDL177-08, noting that the trigger values and monitoring requirements remain largely unchanged. All 2020/21 wet season discharge took place in accordance with WDL177-09.

Specific monitoring requirements within WDL177-09 are specified on Conditions 27 – 34 and Appendix 2.

3. MONITORING METHOD

A map of the Brown Site showing WDL177-09 water quality monitoring locations is shown in Figure 2 as well as Appendix 1 of the WDL177-09.

Figure 2 Site layout and surface water sampling sites (DAMOUT1=Site 2)

3.1 Water Management Strategy and Receiving Environment

The site entered a care and maintenance phase in January 2009 following operational activities from July 2007. Water management infrastructure was generally built during and immediately following the site entering care and maintenance. Water at the site is managed using the following mechanisms:

Storm water drainage systems comprising drains and diversion and containment bunds with sumps, pipes and pumps to facilitate pumping contaminated storm water for treatment and discharge to the Main Sediment Dam.

The Browns Project site has a small network of open and underground drains, bunded containment areas and concrete sumps to collect contact water. This contact water is pumped from the containment areas to the water treatment circuit (or 'WTP') within the plant facility. Contact water is captured and pumped to the feed pump box in the WTP. The pipe configuration allows for the feed water input lines to be operated individually or at the same time depending on site requirements. The pit water only slightly exceeds the WDL trigger values and is used as the main feed source to the WTP and is used to blend the stockpile contact water.

Feed water enters the treatment system via Tank #1 and then flows by gravity through Tank #3, Tank #5 and then Tank #7. These three tanks have agitators in place to facilitate the circulation of the lime through the water column. Flocculant is introduced into Tank #7 via a distribution pipeline at a constant flow rate. The flocculant aggregates the precipitated metal particles while gently agitating the water to keep the particles in suspension. This water is then gravity fed into CCD1 and LTT Tanks concurrently. These tanks provide no agitation. This enables the metal precipitate to settle to the bottom of the tanks where it collects as a metal precipitate slurry.

Treated water flows over the launders at the top of the tanks where it collects in each of the respective overflow tanks. From these overflow tanks the water is then pumped to the CCD2 Tank. This tank represents the 'clean' (treated) water which is then piped via the underflow pump to the Pre-Settlement Ponds within the Sediment Dam facility. There is a water quality sampling point (TREAT1) under CCD2 Tank. This sampling point is a WDL 177-09 monitoring site.

Water released from the Pre-Settlement Ponds meanders through a series of vegetated ponds connected via vegetated channels that facilitate the natural filtration of the water. Water from the Sediment Dam is discharged by a valve-controlled pipeline to a naturally-vegetated wetland area that also receives unimpacted flows from Middlebrook Creek. The compliance point (SITE5) for WDL177-09 is about 200 m downstream of the wetland near the fence line that separates the Browns Site from the former Rum Jungle mine site.

The current surface water management strategy aims at preventing the likelihood of poor quality water entering the Open Pit and Main Sediment Dam. Areas that generate poor quality water are currently isolated with bunds and pumps to facilitate treatment of the water prior to release to the Pre- Settlement Ponds. These ponds capture treated and clean site runoff waters and were constructed in 2011 to decrease flow velocity and increase time for particulates to settle out of the water column before overflowing into the Main Sediment Dam.

The open pit is located in the northeast corner of the project area and was bunded in 2010 to prevent contaminated water from the stockpiles from entering the Mine Pit. The eastern wall was also heightened in 2011 following the flooding of the pit by overflow from the East Finniss River during Cyclone Carlos.

Historically, the water level in the open pit was held at a level between 55 and 60 m AHD. Assessments in 2011 indicated that the water level in the oxide open pit should be maintained at a level not higher than 55.8 m AHD (at a level slightly below the bed of the East Finniss River) to inhibit seepage from the pit. Water is currently actively managed via pumping to the CCDs for treatment before being discharged to the Main Sediment Dam.

The water quality entering and leaving the Main Sediment Dam is currently monitored regularly in accordance with the schedule specified in WDL177-09. Water quality in the Main Sediment Dam must be of sufficient quality so that water at WDL Site 5 can meet the trigger values listed in WDL 177-09 (Table 1). Management actions are to be undertaken if the water quality at WDL Site 5 exceed the trigger values listed.

The Main Sediment Dam has a siphon installed which is utilised to discharge water from storage when the flows within the East Finniss River are above 1.5 m at GS8501200.

3.2 Surface Water Monitoring Program

Current monitoring locations are in accordance with the current Waste Discharge Licence 177-09. Sample frequency and water quality monitoring parameters at the WDL locations (WDL Sites 1, 2, 4, 5 and Treat01) are stipulated as part of the WDL.

Figure 2 illustrates the locations, which were stipulated in Appendix 1 of Waste Discharge Licence (WDL177-09), for surface water sample collection points. There are five surface water collection locations.

- Site 1 is upstream of the discharge point from the Browns Project Site on the East Finniss River and the location was stipulated by Waste Discharge Licence (WDL177-09) conditions. This point represents the receiving water body and allows the comparison of water quality of the treated storm water to the receiving water quality. This site is not influenced by the activities of the Browns Project.
- Site 2 is in the sediment dam (see Damout1 on Figure 2). This dam captures treated storm water and is discharged to the East Finniss River as per Waste Discharge Licence (WDL177-09) conditions.
- Site 4 is Middlebrook Creek which is upstream of discharge point and originates offsite. This creek runs on to site.
- Site 5 is the authorised discharge point in the Waste Discharge Licence (WDL177-09) and is the location Site 4 (Middlebrook Creek) exits the site after mixing with project discharge water and flows into the East Finniss River.
- Treat01 is the point located in the Water Treatment Plant immediately after the water comes out of the Plant. This water is pumped from the Water Treatment Plant to Site 2.

In addition, GS200 is monitored downstream of Site 5 to facilitate hardness corrections for determination of Site 5 compliance for filtered metals.

The receiving environment of the discharge water is downstream of a contaminated legacy mine site, the former Rum Jungle mine. This site was a copper and uranium mine with several open pits and also contained a number of other associated metals. The mine was operational during the 1950's and 1960's and was closed with minimal rehabilitation leading to major environmental problems that exist today.

There are a total of five surface water monitoring locations which will be utilised across the Project area for the current licence. Sampling locations will only be sampled when they are flowing. The locations and sampling frequencies and, water quality monitoring parameters are detailed in Table 1 and their locations are displayed Figure 2.

Table 1 WDL117-09 sampling schedule and trigger values

Site Code				**Site 1**	**Site 2**	**Site 4**	**Site 5**	**Treat01**	
Parameter	Abbr.	Unit	Analysis	Monitoring Frequency					Trigger Values1
Field Measurements									
Water Level		m	In Situ	W	W	W	D	W	N/A
pH	pH	pH							6.5-8.5
Electrical Conductivity	C	µS/cm							700[2]
Dissolved Oxygen	DO	% sat.							N/A
Turbidity	NTU	NTU							ND

Sodium	Na								ND
Chloride	Cl								ND
Sulfate	SO4								ND

Table 1 Key:

D = Daily during months of discharge and at least once per discharge event.

W = Weekly during months of discharge and at least once per discharge event.

[1] Trigger Values for dissolved metals are default ANZECC values at 80% species level protection and are to be applied to discharge water at the Compliance Point (Site 5) only.

[2] Trigger Values for EC is the average concentration of EC at Site 1, derived using data from the 2016/17 and 2017/18 Wet Seasons.

[4] Trigger Values may be modified to account for hardness, on a per sample basis, as measured at GS8150200 and in accordance with the ANZECC 2000 Guidelines.

[5] All filtered samples must retain a total sample – the total sample can be used to confirm an exceedance of a filtered sample in the lab

N/A – Not Applicable

ND – Not Determined

A flow meter installed at DAMOUT1 measures the volume of water discharged via Site 5. The total volume of water discharged during 2020/21 was 586ML.

3.3 Surface Water Sampling Procedure

Field measurements

Surface water monitoring is to be undertaken in accordance with the following:

- Complete surface water quality sheet for location.
- Measure water quality parameters using calibrated probes

Record field water quality parameters by either suspending the water quality meter within the water body or collecting a sample and placing into a bucket for measurements to be taken.

Laboratory measurements

Surface water monitoring is to be undertaken in accordance with the following:

1. Complete surface water quality sheet for location.
2. Collect sample using appropriate lab supplied bottles

3. Grab Sample

Rinse long arm sampler container in the water body to be sampled three times. Place long arm sampler directly into water body, open end vertically down and fill with an arc motion with the bottle mouth facing upstream. Take care to avoid collecting surface films. For waters less than half a metre in depth, collect a grab sample at half the water depth. For waters greater than half a metre in depth, a grab sample should be taken at 20 to 30 cm below the surface water.

A total metals sample (not filtered) and a dissolved metal sample should be collected. The dissolved metal sample required field filtration through a disposable 0.45 µm filter.

4. Waste Disposal

Excess surface water is to be returned to ground and all disposable sampling equipment used should be stored for disposal at the site office including filters.

5. Electronic Transfer

All water quality results, duplicate locations and Chain of Custody (CoC) are to be scanned and kept on file. All data, both field and laboratory, is to be entered into ESdat for storage and retrieval.

3.4 Surface Water Trigger Values

The assessment guideline values adopted from the Project are adopted from default ANZECC/ ARMCANZ 2000 freshwater trigger values for 80% aquatic ecosystem protection. The trigger values are to be applied at WDL Site 5 as per the WDL 177-09. Trigger Values may be modified to account for hardness, on a per sample basis, as measured at GS8150200 and in accordance with the ANZECC 2000 Guidelines – see Table 3.4.3. The calculated Hardness Modified Triger Levels for Site 5 are provided in Appendix B.

3.5 Quality control

Laboratory quality control

Samples are analysed at a NATA accredited laboratory - Eurofins. The laboratory quality assurance processes include reagent blanks, matrix spikes, internal standards and surrogate spikes.

Field quality control

The QC program is to be undertaken in accordance with the general relevant requirements set out in the Australian Standard AS4482.1 (2005). QC samples provide information that discounts or potentially identifies any errors due to possible sources of cross contamination, inconsistencies in sampling and analytical techniques used. The QC program to be completed includes a split duplicate.

Field quality control procedures will include the collection and analysis of the following:

- Blind field duplicates (BFDs): Comprise a single sample that is divided into two separate sampling containers. Both samples are sent anonymously to the primary Project laboratory. Blind duplicates provide an indication of the analytical precision of the laboratory, but are inherently influenced by other factors such as sampling techniques and sample media heterogeneity.

4. RESULTS

All water quality monitoring results are provided in:

- Appendix A – field parameters for 1 July 2020 to 30 June 2021
- Appendix B – laboratory results for 1 July 2020 to 30 June 2021
- Appendix C- graphs of field and laboratory data by monitoring site
- Appendix D – graphs of data for 1 July 2018 to 30 June 2021
- Attached excel files

Table 2 shows the volume of treatment on site and discharge from DAMOUT1 (Site 2) during 2020-21.

Table 2 Water treatment and discharge for 2020-21

Month	Water Treated (m^3)	Water Discharged (m^3)
Jul-20	7,4720	0
Aug-20	6,074	0
Sep-20	5,368	0
Oct-20	28,086	0
Nov-20	24,478	0
Dec-20	81,885	0
Jan-21	83,558	105,584
Feb-21	136,250	184,150
Mar-21	164,511	296,908
Apr-21	80,889	0
May-21	0	0
Jun-21	39,744	0
Total	725,563	586,642

Note that a large salt water crocodile was observed in the East Finnis River on 18 March 2021. Sampling at Site 1 and GS200 was subsequently suspended for safety reasons. NTR advised the NT EPA of this on 19 March 2021 and submitted a non-compliance notification on 30 March 2021. A large salt water crocodile (approx. 3 m long) was caught on 10 April 2021 near Site 1. NT Government Crocodile Rangers removed the crocodile from site. Upon the advice of NT Government Crocodile Rangers, the traps were reset for a three week period to determine if any further crocodiles were present. A small freshwater crocodile was caught in the trap during the week commencing 19 April 2021, which the Rangers advised was an indictor that salt water crocodiles were unlikely to be present. The traps were re-checked (no crocodiles were caught) and removed on 29 April 2021 by NT Government Crocodile Rangers. Sampling at Site 1 and GS200 resumed in accordance with the requirements of WDL177-09 in May 2021.

Site 1

Appendix A show Site 1 water quality parameters pH, conductivity, temperature, dissolved oxygen, redox potential and turbidity. The data Table 3 below illustrates the minimum, maximum, average and standard deviation of the data from July 2020 to June 2021. As with the previous site there is a small dilution effect from the wet season.

The site is downstream of where the Rum Jungle contamination enters the East branch of the Finniss River. Appendix C graphs the data and shows that average pH is low for a natural site and conductivity is high. Average Turbidity is also high. This site is slightly downstream of the confluence of where contaminated AMD waters flow into the river from Rum Jungle.

Table 3 Site 1 water quality parameters basic statistics for 2020 to 2021

Site 1	Temperature (Field)	DO (Field)	Redox Potential (Field)	DO % Saturation (Field)	Electrical Conductivity (field)	pH (Field)	Turbidity (Lab)
	oC	mg/L	mV	%	µS/cm	-	NTU
Min	18.2	2.7	102.0	33.0	3.2	3.1	2.9
Max	32.5	6.9	485.0	90.2	1599.0	8.4	30.0
Average	27.5	3.7	208.6	46.5	240.9	6.5	10.3
StDev	3.0	0.9	91.0	11.5	358.7	1.2	9.1

Table 4 and Table 5 (from Appendix B) show the min, max, average and standard deviation of the inorganic data and the metal data for Site 1 respectively. Both data sets show elevated readings for SO_4 and $CaCO_3$ for the organics, and elevated results for Pb, Al, Cd, Ca, Co, Fe, Mn, Mg, Ni, K and Zn. These elevated results would be a result of the Acid Mine Drainage (AMD) that is present at the Rum Jungle site and the mobilisation of these metals through the AMD. These results are at their highest during first flush events which is associated with the early wet season.

Table 4 Site 1 inorganics results basic statistics for 2020 to 2021

Site 1	Chloride	Sodium	Sulphate	Hardness as CaCO3	Total Suspended Solids (Lab)
Minimum	1.1	0.7	11.0	10.0	1.2
Maximum	55.0	15.0	3500.0	4300.0	50.0
Average	11.8	3.8	425.4	447.1	10.9
StDev	14.2	2.8	911.1	990.9	12.7

Table 5 Site 1 filtered metals results basic statistics for 2020 to 2021

Site 1	Aluminium (filtered)	Cadmium (filtered)	Calcium	Chromium (III+VI) (filtered)	Cobalt (filtered)	Copper (filtered)	Iron (filtered)	Lead (filtered)	Magnesium	Manganese (filtered)	Nickel (filtered)	Potassium	Uranium (filtered)	Zinc (filtered)
Minimum	0.050	0.000	1.000	0.000	0.007	0.015	0.060	0.001	1.900	0.031	0.008	0.500	6.000	0.007

Site 2

Appendix A show Site 2 water quality parameters pH, conductivity, temperature, dissolved oxygen, redox potential and turbidity. The data in Table 6 below illustrates theminimum, maximum, average and standard deviation of the data from July 2020 to June 2021. Appendix C graphs the data and shows that average pH is within a normal range and conductivity is also within a normal range. Average Turbidity is within normal ranges. This site is the receiver of treated water from the Browns Water Treatment Plant and the water quality is reasonable prior to its discharge from Site 5.

Table 6 Site 2 water quality parameters basic statistics for 2020 to 2021

Site 2	Temperature (Field)	DO (Field)	Redox Potential (Field)	DO % Saturation (Field)	Electrical Conductivity (field)	pH (Field)	Turbidity (Lab)
	oC	mg/L	mV	%	µS/cm	-	NTU
Min	21.3	1.9	60.9	25.0	229.1	6.8	0.8
Max	33.4	293.0	237.7	106.2	757.0	8.5	16.3
Average	29.4	9.9	161.4	46.8	477.7	7.7	3.8
StDev	2.7	42.7	37.4	18.4	173.9	0.4	3.1

Table 7 and Table 8 (from Appendix B) show the min, max, average and standard deviation of the inorganic data and the metal data for Site 2 respectively. Both data sets show results that are within acceptable limits for all the parameters that are analysed. Most metal data are low, indicating that the main sediment dam is not storing potentially polluted water that could, in a major wet weather overflow, be discharged from the site.

Table 7 Site 2 inorganics results basic statistics for 2020 to 2021

Site 4

Appendix A show Site 4 water quality parameters pH, conductivity, temperature, dissolved oxygen, redox potential and turbidity. The data shown in Table 9 below illustrates the minimum, maximum, average and standard deviation of the data from July 2020 to June 2021. Appendix A shows that average pH is within a normal range and conductivity is also within a normal range. Average Turbidity is within normal ranges. This site is a natural ephemeral creek that enters the mine site from the East and exits feeding the wet land area and into the East branch of the Finniss River downstream of the Rum Jungle affected Site 1. It is unaffected by Browns Project during its transit through the site. The site is generally dry in the dry season and no sampling occurs in that period.

Table 9 Site 4 water quality parameters basic statistics for 2020 to 2021

Site 4	Temperature (Field)	DO (Field)	Redox Potential (Field)	DO % Saturation (Field)	Electrical Conductivity (field)	pH (Field)	Turbidity (Lab)
	oC	mg/L	mV	%	µS/cm	-	NTU
Min	21.2	1.6	95.5	19.3	2.3	6.0	2.4
Max	33.1	4.4	222.0	57.3	44.0	8.3	26.2

StDev	2.5	0.8	33.9	10.4	8.1	0.7	4.7

Table 10 and Table 11 (from Appendix B) show the min, max, average and standard deviation of the inorganic data and the metal data for Site 4 respectively. Both data sets show results that are within acceptable limits for all the parameters that are analysed. Most metal data are low, with some elevated readings due to natural first flush cycles.

Site 5

Appendix A show Site 5 water quality parameters pH, conductivity, temperature, dissolved oxygen, redox potential and turbidity. The data Table 12 below illustrates the minimum, maximum, average and standard deviation of the data from July 2020 to June 2021. Appendix A shows that average pH is within a normal range and conductivity is also within a normal range. Average Turbidity is within normal ranges. This site is the compliance point for the Water Discharge Licence (WDL 177-08) and all exceedances have been recorded and reported as per the monthly reports to NTEPA Appendix G.

Table 12 Site 5 water quality parameters basic statistics for 2020 to 2021

Site 5	Temperature (Field)	DO (Field)	Redox Potential (Field)	DO % Saturation (Field)	Electrical Conductivity (Field)	pH (Field)	Turbidity (Lab)
	oC	mg/L	mV	%	µS/cm	-	NTU
Min	18.0	0.9	73.0	11.7	37.4	5.5	1.2
Max	31.1	207.0	380.0	80.8	1016.0	7.9	55.9
Average	26.6	4.2	177.3	30.3	183.2	7.0	5.2
StDev	2.3	19.2	53.6	9.6	153.9	0.3	7.7

Figure 3 shows pH and EC at Site 5 during the reporting period. During the periods where discharge was occurring, pH and EC complied with the WDL discharge trigger values. Five instances of low pH were measured, however these all occurred during no discharge periods. Similarly, two instances of EC above the trigger levels were measured in December 2020 before the commencement of discharge. The end of the dry season / early wet season is often characterised by low pH/high EC water quality at Sites 1, 5, and GS200, which reflect low dilution in the River. The low pH (6.18) measured on 26 February 2021 may be a field data sheet recording error. It is likely that the pH should have been pH 6.81 which would be consistent with pH data measured during adjacent days.

Figure 3 pH and EC from Site 5

Table 13 and Table 14 (from Appendix B and Appendix E) show the min, max, average and standard deviation of the inorganic data and the metal data for Site 5 respectively. The inorganic data show an acceptable average. The monthly reports to NTEPA in Appendix B and Appendix G calculate the Hardness Modified Trigger Levels for discharge at Site 5. The Hardness Modified Trigger Levels are generally higher than the standard trigger levels specified in the WDL (due to hardness > 30 mg/L in the River). During periods of discharge, the Hardness Modified trigger Levels or the 3 x Trigger Levels values were not exceeded. The Hardness Modified Trigger Levels were determined by measured Hardness at GS200 and applied to the metals concentrations at Site 5 for samples taken on the same day.

Table 13 Site 5 inorganics results basic statistics for 2020 to 2021

An elevated spike of metals was measured on 3 March 2021 at Site 5 (although no discharge was occurring at that time). Similar concentrations of elevated metals were measured at Site 1 and GS200 on the same day, possibly indicating that a slug of contaminated water was released from upstream at that time.

Treat01

Appendix A show Treat01 water quality parameters pH, conductivity, temperature, dissolved oxygen, redox potential and turbidity. Table 15 below illustrates the minimum, maximum, average and standard deviation of the data from July 2020 to June 2021. Appendix A shows that average pH is high because of the water treatment process which artificially raises the pH with a reagent so as to precipitate out the contaminate metals before being pumped to (Sediment Dam). All other parameters are within a normal ranges at this site which is situated in the Water Treatment Plant after the water is treated and before it is pumped to the main sediment dam (Site 2).

Table 15 Site Treat01 water quality parameters basic statistics for 2020 to 2021

5. QUALITY ASSURANCE

All laboratory data were measured and reported at a NATA accredited laboratory, Eurofins.

Duplicate samples were generally taken at Site 5 for QAQC and comparison purposes.

Field probes were calibrated according to the manufacturer's instructions.

Additional information is provided at:

- Appendix E– QAQC calculations and results for 1 July 2020 to 30 June 2021
- Appendix F – Chain of Custody documentation for 1 July 2020 to 30 June 2021

6. DISCUSSION

Monitoring was undertaken in accordance with the requirements of WDL177-09 during the 2020-21 reporting period. Monthly discharge reports were submitted where discharge occurred during the months January 2021-April 2021. During the period where discharge was occurring, the discharge water quality measured at Site 5 complied with the trigger levels specified in WDL177-09 (noting that a non-compliance requires three consecutive exceedances of the WDL trigger level or an exceedance of the three time trigger level during periods of discharge). Notwithstanding the compliance obligations, it is apparent that dissolved copper was measured at Site 5 at concentrations slightly above the trigger level or the Hardness Modified Trigger Level during the early part of the wet season. It is likely that these slightly elevated copper concentrations originate from upstream in the East Finnis River as discussed below.

Monitoring data for Site 1 and GS200 which is located upstream of Site 5 and located in the East Finnis River is provided in Appendix B (NB: GS200 is additional to the monitoring requirements specified in WDL17-09) and graphically shown in Appendix C where upstream results (GS200, Site 1) are compared to the discharge water quality (Site 5). Of note is the consistently high concentration of copper, cobalt, nickel and zinc in samples collected at Site 1 and GS200 site. Similarly, pH is often lower and EC higher at the upstream locations. The general observation is that during the wet season high frequency monitoring period, monitoring at Site 1 and GS200 results exceed the copper, cobalt, nickel and zinc concentration measured at the Site 5 monitoring location generally by an order of magnitude (or in some instances more).

One significant water quality event was measure on 3 March 2021 in the 1 hour prior to discharge sample at Site 5 where the concentrations of metals was very high. Very high metal concentrations were measured at Site 1 and GS200 between July-September 2020, suggesting that metal loads (presumably from Rum Jungle) are entering the East Finnis River. Comparing upstream water quality data (Site 1 and GS200) to the water being discharged from the Brown's Site shows that the discharged water is of significantly better quality that the ambient water quality and should contribute to a dilution of copper, cobalt, nickel and zinc concentrations in the River.

Water quality monitoring data measured at Site 2, Site 4 and Treat01 are all consistent with previous monitoring results, indicating that the Brown Site is performing in a generally stable manner. Water quality treatment on site is precipitating metals under high pH/alkalinity, and further polishing is occurring in water quality ponds as measured at Site 2. No management actions were implemented during the reporting period in response to monitoring undertaken in accordance with WDL177-09, other than routine operation and maintenance of the Water Treatment Plant as well as the site water management system which comprises several pumps, pipelines and earthen dams, bunds, diversion and the like.

There are no discernible trends evident from the data since 2018 apart from the seasonal effects of wet and dry seasons. Copper has been above trigger values on several occasions at Site 5 during this period, however this generally occurs when discharge is not occurring and is more reflective of water quality in the East Finnis River (see Site 1 and GS200 data). In 2020-21, no exceedances were recorded at Site 5 during discharge events that occurred between January and April 2021. The improvements in the since the wet season of 2019-20 can be attributed to an improved method of comparing trigger values to results after taking water hardness at GS200 and the refinements made to the Water Treatment Plant itself by NT Resources.

7. CONCLUSIONS

Water quality monitoring has been undertaken in accordance with the requirements of WDL177-09. During the period 19 March 2021 to 1 May 2021, water quality monitoring at Site 1 and GS200 could not be safely undertaken due to a large salt water crocodile present in the River. However, based on monitoring data either side of that data gap, it is apparent that wet season water quality in the River is generally worse than the discharge water quality at Site 5.

Site 5 complied with the discharge trigger requirements during period of discharge. During discharge periods, there were a no exceedances of the 3 x Trigger Levels or the Hardness Modified Trigger Levels.

The water quality management, monitoring and reporting framework is working well and NTR does not recommend any change to the treatment/discharge system or WDL177-09 at this stage.

***RPDs have only been considered where a concentration is greater than 1 times the EQL**

****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 50 (1 - 10 x EQL); 30 (10 - 30 x EQL); 20 (> 30 x EQL))**

*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory**
