Minister, I believe it relevant to consider firstly that this project will cause climate heating emissions by its very nature. Co2 when the gas is eventually burned and methane from fugitive emissions. No gas project is immune from this. The atmosphere we are surrounded by will heat up globally no matter which part is impacted. Hydraulic fracking also causes sub level movement, which are frequently listed as earth tremors. These are dangerous and damaging to property and any below ground infra structure. Fracking also causes pollution to precious groundwater. We voted for the Albanese Government to tackle climate change and continuity of coal, oil and gas projects is contrary to this. I advise you to also consider nature in the immediate area. Pollutants in water and soil are harmful to wildlife and native vegetation and must be considered when assessing projects such as this. Local indigenous populations also rely on this water to live. We have no right to risk pollution of this vital water, even if the risk is regarded as minor. The environment is used to support life for all humans and other species and it should not be regarded as an acceptable risk under any circumstances to bolster a company's profit margin. Labor is the people's government and the people are asking you to put a halt to this project.
