Re the Carpentaria Pilot Project. My objections to this project are that the environmental research has not been done and there's too much risk to biodiversity and social/cultural interests to proceed. This can be seen by what's happened in Katherine and other places around the world with PFAS contamination. You can filter the water at huge expense to provide potable water for the human residents but has this helped the wider environment? Fracking - especially to the extent proposed will be a million times worse. The proponent has not provided enough evidence to justify their actions. We can't afford any further contamination of our precious and dwindling potable water resources. Project research must include evidence of how the process of selling appraisal gas will lower GhG emissions for the NT to be able to reach its 2050 zero emissions target. Why haven't traditional owners been kept up to date and properly consulted on this project?
