If yes, please enter the name of the organisation:

Submission contents

Submission details:

Water usage – How much will each phase of construction use and what will be the maximum usage each year? What effects will it have on aquifers? Power usage – What is the maximum usage of gas estimated each day? What type of cooling systems will be used? Please provide easy to understand diagrams and descriptions. What will be the long-term community benefit? Will locals be employed, what will be the number of permanent jobs after construction? What are the maximum decibels that will be produced and what will be the effect on those working there and local wildlife, including burrowing bilbies? What will be done with water contaminated during the cooling process and what is the average chemical composition of water that has been used in the types of cooling systems that will be used in this project? What natural habitats will be destroyed in the process of building this project? What is the average temperature of the area now and what will it likely be once the project is completed, taking into account past differences between temperature in places with and without trees in the same climate. What effects will the heat have on the mental health and safety of construction workers and those who will work there after it is built? How will important information regarding the environmental impact and usage of resources for this project be effectively disseminated into the wider community of the Northern Territory?
