We love the NT having visited there often and are disturbed by the scale of this project .This solar farm on Muckaty Station is too huge and dominating on the landscape; It puts at risk animal life like the greeater bilby . This is their territory. Land covered in solar apparatus makes it no longer animal habitat. The bilbies, together with other animal life w will be put at risk. Much more attention needs to be given to researching this issue. The proposal is hige 105,000 ha with a footprint of 49,300.ha. I'm in favour of solar farms but not when the footprint could have such a devastating impact on the wildlife which live here. The endangered Grey Falcon is another animal which could be put at risk. There needs to be a full scale invstigation into the environmental effects of covering such a huge area lin solar plant. Thank you for the opportunity to comment and I trust the desirability of a solar farm is kept in proportion so healthy wildlife habitat will be proteced. Sincerely Sally Wylie
