Submission contents:

This looks like a really exciting research project to help the fight against climate change. Around the world there are lots of Blue Carbon Credit projects and this one looks like it has plenty of potential and is in our own country.

I will be very interested in seeing how well this project helps to reduce CO2 emissions due to avoiding soil carbon loss and how well this project can help to reduce the negative impacts of coastal flooding. Hopefully it can help to improve the habitats of the marine life in the area and give locals the opportunity to gain new employment by the jobs it will create. It is fantastic that this project will protect and conserve the cultural heritage in the area as well.
