EXECUTIVE SUMMARY

All sampling specified in WDL 212-02 for Channel Island Power Station (CIPS) was undertaken for the reporting period, April 2020 to May 2021.

- In total, CIPS has discharged 106.1 ML of wastewater for the 14 months period (April 2020 to May 2021).
- Based on the monitoring results under WDL 212-02, there were no non-compliances at CIPS during the period April 2020 to May 2021. However, occasional exceedances of Dissolved Oxygen and Total Suspended Solids were reported in the receiving environment (Darwin Harbour). It was found that CIPS discharge is not a contributing factor for these exceedances. Dissolved Oxygen and Total Suspended Solids are parameters that can be highly variable due to external factors such as tidal movements and presence of oxygen demanding materials in the surrounding environment. These exceedances are not required to notify NTEPA under condition 35, WDL 212-02 (WDL 212-02, 2020).

Based on the monitoring results for the reporting period, there was no evidence of impact from wastewater discharged from CIPS on the Darwin Harbour receiving environment.

1 INTRODUCTION

Channel Island Power Station (CIPS) is the largest power station in the Northern Territory, Australia. It is located on Channel Island in the Middle Arm of Darwin Harbour. It is the main source of electricity for the Darwin - Katherine Interconnected system. The first units were commissioned at CIPS in 1986, and Channel Island now has 310MW of installed capacity.

Treated wastewater from CIPS facility is discharged into Darwin Harbour through the designated discharge points. CIPS facility has two discharge outlets to Darwin Harbour (Figure 1). These two outlets receive wastewater from different sources as indicated in Figure 2 (cooling towers, cooling ponds and stormwater). CIPS also consists of a sewage treatment plant licenced under the Department of Health's "wastewater work design approval" (WWDA, 2016).

Waste Discharge Licence, WDL 212, was first issued to CIPS on November 2015 to November 2017 by the Northern Territory Environmental Protection Authority (NT EPA). CIPS wastewater discharges to Darwin Harbour is currently managed under renewed Waste Discharge Licence WDL 212-02 from 18 June 2020. This licence is valid until 17 June 2022. The current licence, WDL 212-02 codifies operational practice for the management of waste discharges from the CIPS facility.

As per WDL 212-02, water, wastewater and sediment monitoring at designated sampling points is required. From December 2015 to March 2016, the monitoring for the WDL 212 was conducted by National Aluminate Corporation (NALCO) and ECOLAB. Tropical Water Solutions (TWS) was contracted by Territory Generation (TGen) in April 2016 to conduct the required monitoring program and to manage the waste discharge licence activities.

This annual report is prepared by TWS on behalf of TGen as a part of WDL 212-02 requirement. It provides details of the wastewater and sediment monitoring program and provides interpretation of *in-situ* and laboratory analysis results of physical, chemical and biological parameters. The reporting period for this report is from April 2020 (date of data reported in last annual return) to May 2021 (the most recent results available at the time of this report preparation). The CIPS wastewater discharge from April 2020 to June 2020 was managed under WDL 212-01 and from June 2020 – current it is managing under WDL 212-02. In Appendix A, monitoring data from April 2016 can be found as graphs and tables for easy reference to previous reporting periods.

Figure 1: CIPS discharge outlets

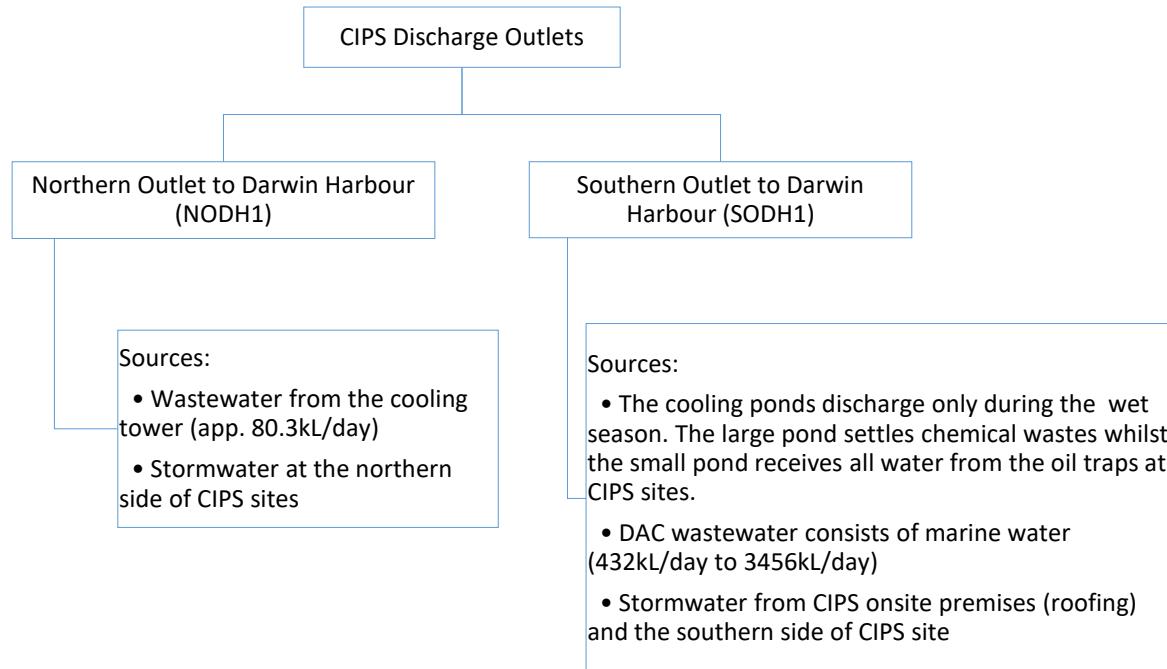

Figure 2: Stormwater and wastewater sources at CIPS discharge outlets

1.1 Wastewater discharge from Channel Island Power Station

Channel Island Power Station (CIPS) has two wastewater discharging sources (Figure 3); the first one is the cooling tower discharge point (ADP1). ADP1 receives wastewater from the cooling tower which then flows through the drainage line to the northern stormwater drainage to the Darwin Harbour. The sampling point is at the end of northern stormwater drainage (NODH1). The second discharge source is the cooling ponds wastewater discharge point (ADP2) that receives wastewater from two cooling ponds which then proceeds along the drainage line going to the southern stormwater drainage (SODH1) to the Darwin Harbour.

As shown in Figure 3, the cooling ponds receive water from the neutralization basin and oil and water separator plant.

SODH1 receives stormwater from CIPS onsite premises (roofing) and the southern side of CIPS site in addition to water from ADP2.

Discharge from the cooling tower that mixes with stormwater during rain events drains through the northern stormwater drain (NODH1) passing through rocks and mangroves before entering Darwin Harbour.

Mangrove population density around both the southern and northern stormwater drain is relatively low and the distance of the receiving water body from both storm water drains is no further than 30 m.

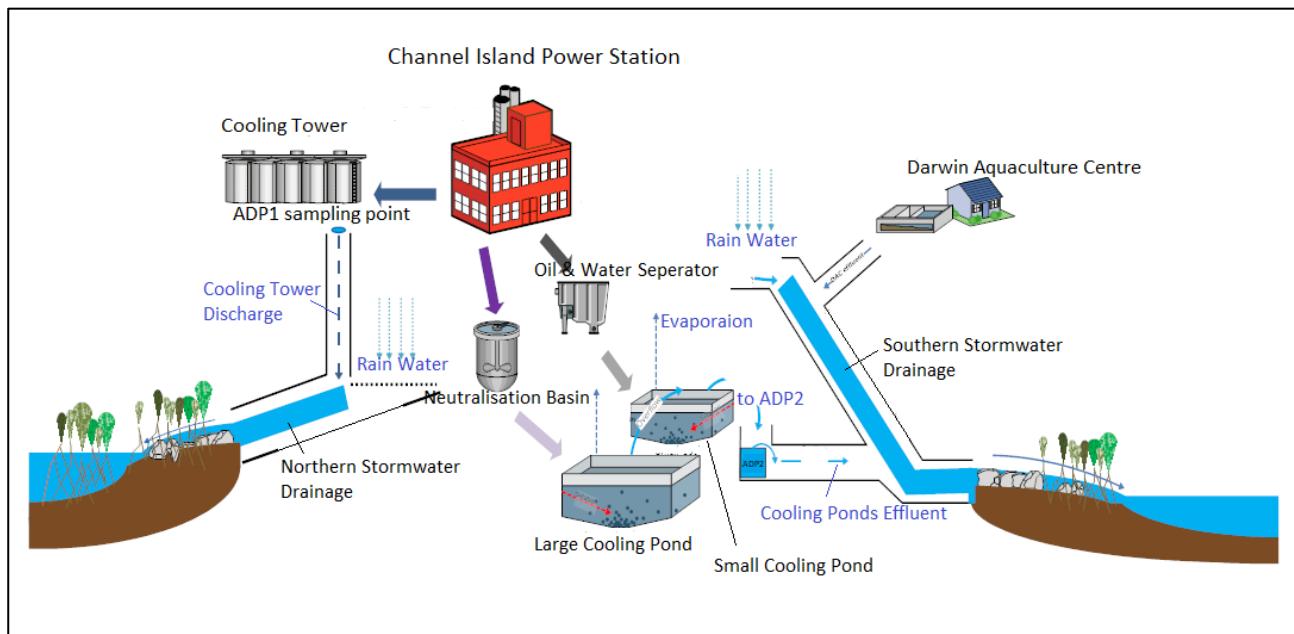

Figure 3 Channel Island Power Station wastewater discharge facility

2 METHODS

2.1 CIPS Monitoring sites under WDL 212-02

2.1.1 Water and wastewater monitoring sites

Wastewater discharge monitoring was carried out from seven (7) sites during April 2016 to May 2018 under WDL 212. Four additional marine water sites located in Darwin Harbour were introduced to the monitoring program beginning July 2018 with the waste discharge licence, WDL 212-01 and continued monitoring under WDL 212-02. All site codes, site descriptions and site coordinates included in the WDL 212-02 are shown in Table 1. Figure 4 shows the google map of the all the monitoring sites.

Table 1: Water and Wastewater Monitoring Sites

Site Code	Description	Coordinates (degrees)
SODH1	Southern Outlet to Darwin Harbor (Drain prior to mixing in receiving environment)	Lat: -12.560474 Long: 130.862878
NODH1	Northern Outlet to Darwin Harbor (Drain prior to mixing in receiving environment)	Lat: -12.554271 Long: 130.863497
ADP1	Cooling Tower Wastewater Discharge (Representative of discharge from cooling tower to drainage system that flows to NODH1)	Lat: -12.554760 Long: 130.864055
ILCP	Large Cooling Pond Influent	Lat: -12.555856 Long: 130.86405
ISCP	Small Cooling Pond Influent	Lat: -12.555856 Long: 130.864055
ADP2	Cooling Ponds Wastewater Discharge (Representative of discharge from cooling ponds to drainage system that flows to SODH1)	Lat: -12.556639 Long: 130.864559
SODH3	Southern Discharge Point Mixing Zone (marine)	Lat: -12.560221 Long: 130.864483
SODH4	Southern Receiving Environment Monitoring Point (marine)	Lat: -12.560540 Long: 130.864483
NODH3	Northern Discharge Point Mixing Zone (marine)	Lat: -12.555015 Long: 130.862802
NODH4	Northern Receiving Environment Monitoring Point (marine)	Lat: -12.555441 Long: 130.861803

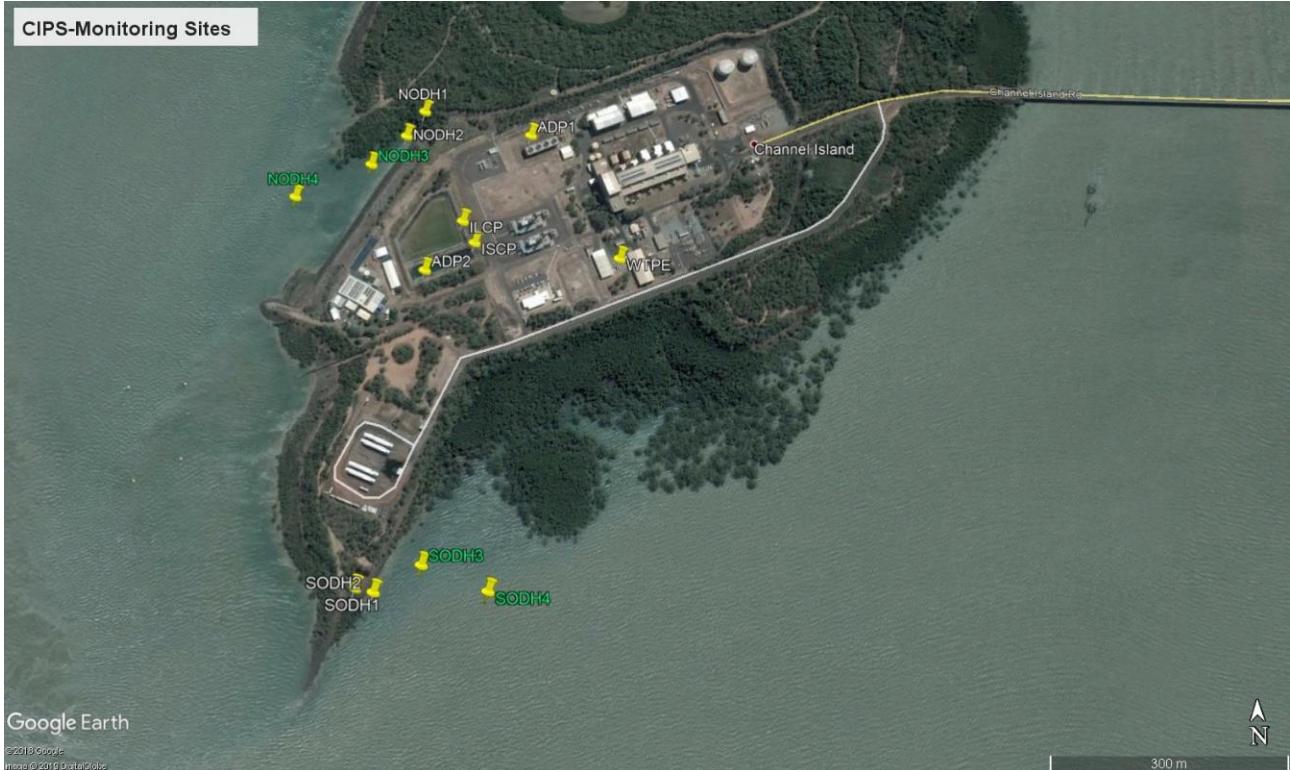

Figure 4: CIPS water, wastewater and sediment monitoring sites

Monitoring signs at the land-based sites are shown in Figure 5.

Figure 5: Monitoring signs at land-based sites

2.1.2 Sediment Monitoring sites

Sediment samples in the receiving environment were collected within the area of potential impact in Darwin Harbour, in the vicinity of the sites NODH1 and SODH1 (Figure 4). The monitored sites are as follows:

- NODH2 - outfall from NODH1 (Lat: -12.554453° and Long: 130.863358°)
- SODH2 - outfall from SODH1 (Lat: -12.6560485° and Long: 130.862941°)

2.2 Monitoring frequencies and parameters

2.2.1 Water and wastewater monitoring frequencies and parameters

Table 2 shows the water and wastewater monitoring frequencies and parameters analysed under WDL 212-02 monitoring program.

Table 2: Water and wastewater monitoring frequencies and parameters analysed.

Sites	Monitoring frequency	Parameters
SODH1 NODH1 ADP1 ADP2	Monthly	<ul style="list-style-type: none"> • Total and Filtered Metals (Aluminium, Arsenic, Cadmium, Chromium, Cobalt, Copper, Lead, Mercury, Nickel, Tin, Zinc) • Nutrients (Filterable Reactive Phosphorous, Total Phosphorous, Total Nitrogen, Nitrogen Oxide (NOx), Ammonia NH₃-N) • <i>E. coli</i> • Physical parameters (pH, Turbidity, Biological Oxygen Demand, Total Suspended Solids, Electrical Conductivity) • In-situ (Free Chlorine, Temperature, Dissolved Oxygen % Saturation)
ILCP ISCP SODH3 SODH4 NODH3 NODH4	Quarterly	

2.2.2 Sediment monitoring frequencies and parameters

Sediment monitoring was conducted on a quarterly basis at sites NODH2 and SODH2. Samples were analysed for metals (Aluminium, Arsenic, Cadmium, Chromium, Cobalt, Copper, Lead, Mercury, Nickel, Tin, Zinc) and hydrocarbons (Total Petroleum Hydrocarbons, Polycyclic Aromatic Hydrocarbons, Benzene, Ethylbenzene, Xylenes and Toluene).

2.3 Sampling procedure

As stated in Waste Discharge Licence WDL 212-02, TWS undertook sampling and monitoring in accordance with Australian Guidelines for Water Quality Monitoring and Reporting (AS/NZS 5667; ANZECC/ARMCANZ, 2000).

2.3.1 In-situ measurements

For all in-situ readings taken at the discharge outlets, two cooling ponds, discharge mixing zones and receiving environment monitoring points, TWS staff used a Hydrolab Quanta multi parameter submersible probe to measure Temperature, Electrical Conductivity (EC), Dissolved Oxygen, pH and Salinity. A Hach 2100Q Turbidimeter was used for Turbidity measurements. Samples were collected from the water flow coming out of the designated sampling points in order to obtain the *in-situ* measurements. Field instruments are calibrated prior to each sampling event and post-field check are undertaken after each sampling event to ensure the instruments are operating within the manufacturer's specifications. All calibration records are available upon request.

2.3.2 Sampling for nutrient and metal analysis

Monthly nutrient and metals samples from ADP1 and ADP2 sample points were obtained from the outflow through the installed v-notches, while samples from SODH1 and NODH1 were collected from the outflow of the drainage pipes. Samples at Darwin Harbour sites were obtained 0.2 m below the water surface using a peristaltic pump.

SODH1 intermittently had significant saltwater influence from the Darwin Aquaculture Centre and/or tidal influence of water pooling at the SODH1 sampling site. Hence, EC or Salinity of the water had to be determined prior to sample collection. This ensured that the appropriate analysis (marine or freshwater analysis) was conducted by the receiving laboratory.

All collected samples were delivered to the Australian Laboratory Services (ALS) in Darwin, where they were couriered overnight to their NATA-accredited Environmental Service Laboratory in Sydney for analysis.

2.3.3 Sampling for microbiological analysis

Microbiological samples from all sites for monthly and quarterly sampling were collected using a sample pole and manual scooping from flowing drainage pipes. Water samples from the Darwin Harbour sites were collected using a peristaltic pump. All microbiological samples were delivered to the NATA-accredited 'Water Microbiology Laboratory' at Berrimah within 3 hours of sampling.

Monthly and quarterly sampling also included obtaining samples for Biochemical Oxygen Demand (BOD) and Total Suspended Solids (TSS) with analysis performed by ALS.

Figure 6 and Figure 7 show sampling at sites in compliance with CIPS WDL 212-02.

Figure 6: Sample collection at Influent Large Cooling Pond (ILCP)

Figure 7: Cooling Tower Discharge Collection Point (ADP1)**2.3.4 Sediment sampling**

Samples were obtained using a stainless-steel grab sampler that can obtain approximately 700 g of sample and dig up to 15 cm of depth into the sediment. Samples obtained in one successful collection were mixed until the sample was homogenised. Samples were stored in a 250 mL glass jars provided by ALS.

Samples obtained were delivered to ALS in Darwin on the same day of collection to be analysed for hydrocarbons and metals at the ALS Sydney laboratory.

3 RESULTS

3.1 Wastewater Discharge Monitoring Results

Detailed discussion on results obtained during the current reporting period starting from April 2020 to May 2021 is included in this section. Monitoring results obtained since April 2016 are also presented.

Results were compared with the guideline values noted in the WQODH (2010), WDL 212-02 (WDL 212-02, 2020) or ANZECC (2000), where available. The guideline values defined are to maintain and protect ecological condition of marine and estuarine system of the Darwin Harbour region. Highlighting exceedances of guideline values in the monitoring results are required to identify and assess influence on water and sediment quality due to the CIPS discharge, if any.

It should be noted that concentrations below their Level of Reporting (LOR) were replaced with the LOR for reporting purposes (graphing). There were some missing data at some sites due to no flow at the times of sample collection. Particularly, there were no discharge at ADP2 for 8 out of 14 sampling events conducted during the reporting period. No flow/minor flow at ADP2 resulted in no flow at SODH1. The lack of flow from the cooling ponds can be attributed to the fact that the ponds are able to hold the discharge from the plant without overflow, especially during the dry season.

3.1.1 Results of in-situ parameters

Temperature

Figure 8 and Figure 9 show the results of Temperature measured at discharge sites and mixing zone/receiving environment (Darwin Harbour) respectively. Temperature was within the range of 23-33 °C at the drains prior to mixing in Darwin Harbour (SODH1 and NODH1) during the reporting period (Figure 8). As shown in Figure 9, water temperature at all Darwin Harbour sites varied between 25.5-32.1 °C for the same period. All the data including results at Cooling Ponds (ILCP and ISCP) are presented in tabulated form in Table A1 , Appendix A.

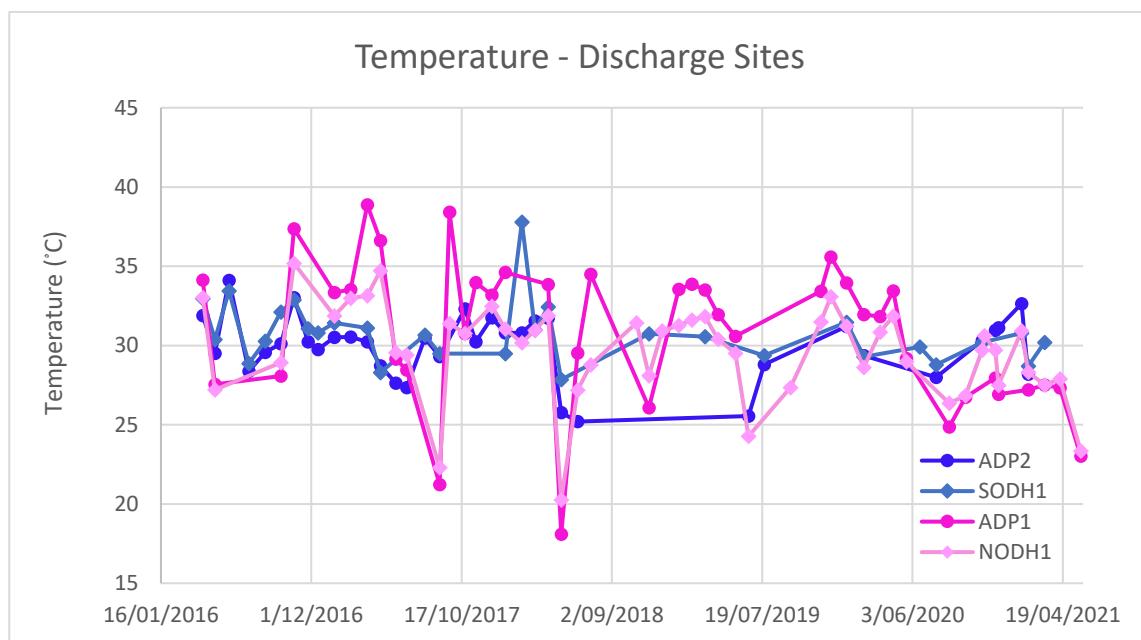

Figure 8: Temperature at discharge sites from April 2020 to May 2021 (Monthly monitoring)

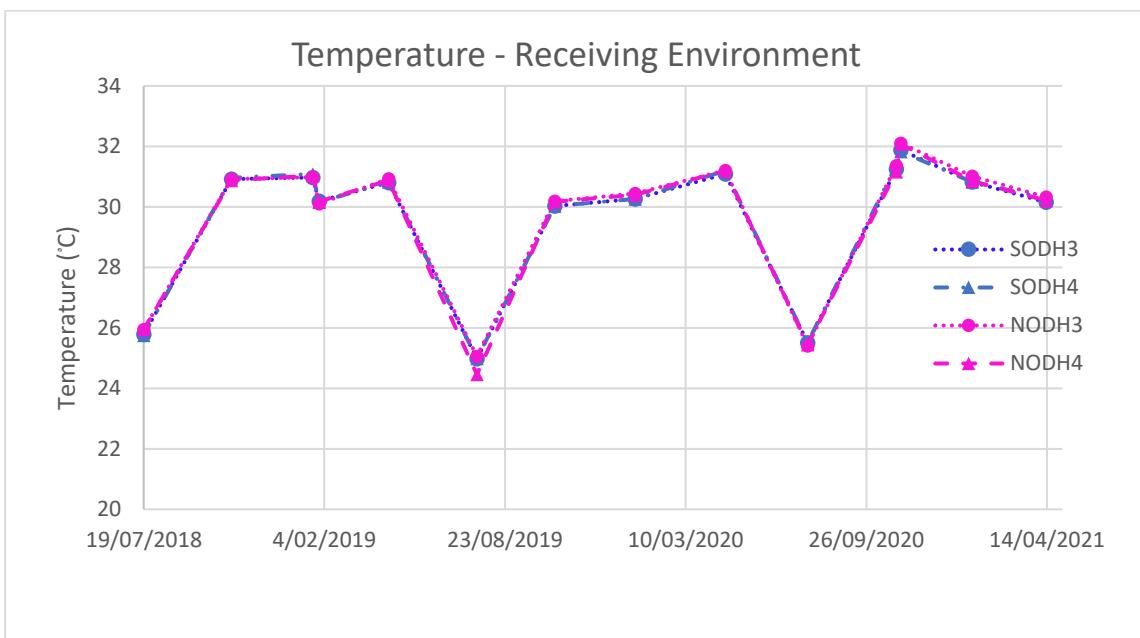

Figure 9: Temperature at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

Dissolved Oxygen

Figure 10 and Figure 11 shows Dissolved Oxygen % Saturation (DO %Sat) at discharge sites and Darwin Harbour monitoring sites. DO % Sat was varied from 41 % to 93.4 % at discharge sites during Apr 2020 to May 2021.

Quarterly monitoring results at Darwin Harbour sites indicate that DO % Sat at all the sites are above the guideline value (80%) noted in WDL 212-02 (Figure 11) except on 13 April 2021. On 13 Apr 2021, DO % Sat at SODH3 and NODH3 was 79.7 % and 76 % respectively. There was no flow from CIPS southern discharge point, ADP2/SODH1 at the time of sampling, indicating that CIPS discharge is not a contributing factor for slightly lower DO %Sat at Darwin Harbour monitoring sites, SODH3. ADP1 (Northern discharge point) had DO %Sat of 86.2 % which is higher than the trigger value while ADP1's downstream site NODH1 having DO %Sat of 72.1 % at the time of sampling. This indicates that even though high DO was present in the CIPS discharge point (ADP1), it can be varied in the downstream sites due to external factors such as presence of oxygen demanding organic materials and tidal movements in the Darwin Harbour. Table A2, Appendix 1 shows the DO % Sat data at all the CIPS monitoring sites.

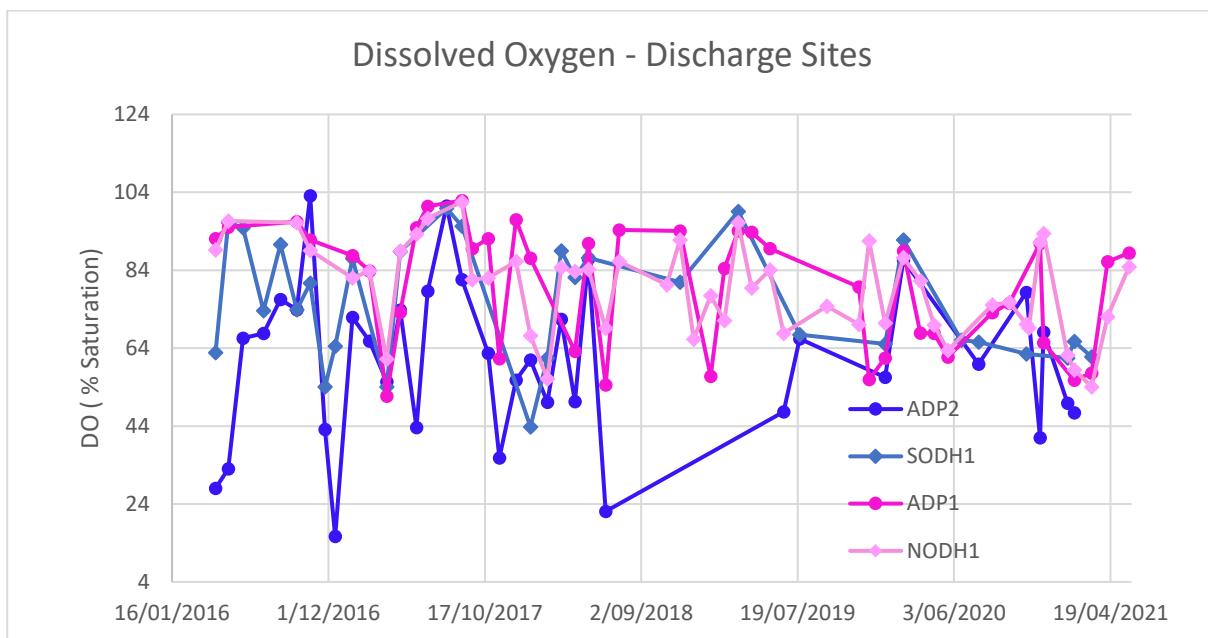

Figure 10: Dissolved oxygen (% Saturation) at discharge sites from April 2020 to May 2021 (Monthly monitoring)

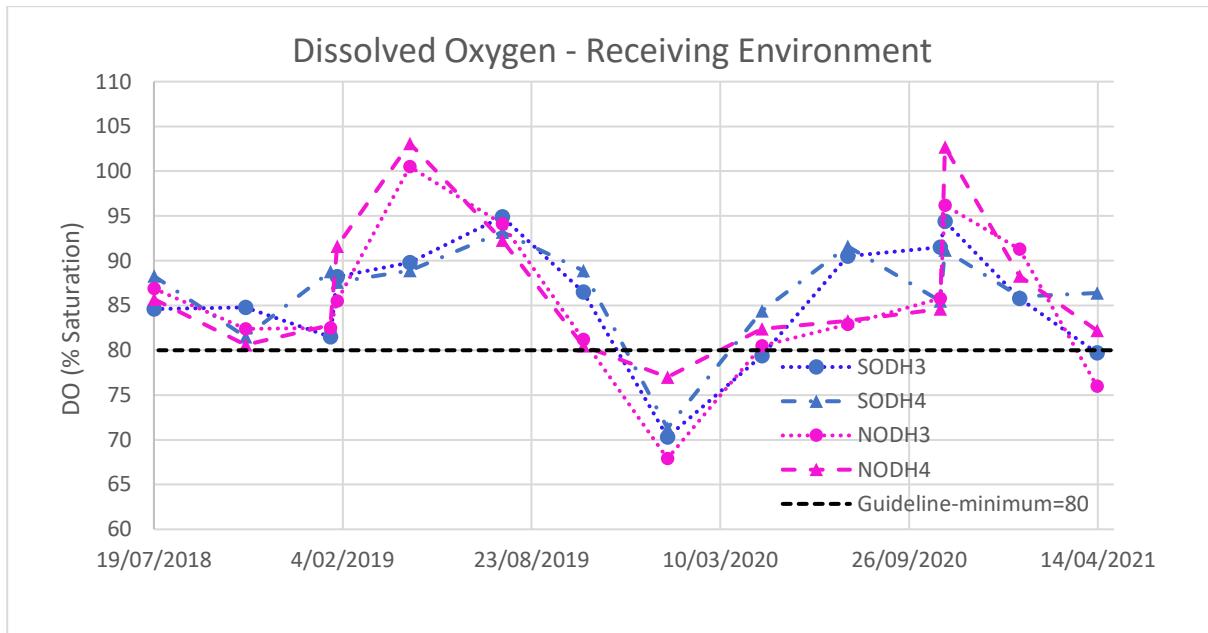

Figure 11: Dissolved Oxygen (% Saturation) at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

Free Chlorine

Free Chlorine concentration at Darwin Harbour sites varied between 0.01-0.04 mg/L for current reporting period (See Appendix A7 for monitoring data). Site specific trigger values for Free Chlorine are to be developed as per Condition 40 of the WDL 212-02 (WDL 212-02, 2020).

3.1.2 Results of other physical parameters

pH and Total Suspended Solids (TSS) at Darwin Harbour sites for the sampling events from Jul 2018 to May 2021 are shown in Figure 12 and Figure 13 respectively. The results were compared with the guideline values specified in WDL 212-02 (WDL 212-02, 2020).

pH at discharge sites varied between 5.93 – 9.73 pH units (Figure A2, Appendix A) during the reporting period. At southern and northern mixing zones and further downstream sites, pH values are within the guideline range of 6.5 - 8.0 pH unit (WDL 212-02) for all sampling events (Figure 12).

TSS concentrations at site NODH3 (21 Jan 2021) and NODH4 (21 Jan 2021) was 19 mg/L and 27 mg/L, respectively (Figure 13) and are above the guideline value of 10 mg/L (WQODH, 2010, WDL 212-02). TSS concentration at CIPS discharge point NODH1 is <5 mg/L and there was no flow from ADP1 at the time of sampling; indicating that CIPS discharge is not a contributing factor for elevated TSS at Darwin Harbour monitoring sites, NODH3 and NODH4. Tidal water movement and stormwater run-off during the wet season could have caused wash-off and suspension of solids particles resulting in elevated TSS concentrations at monitored sites.

TSS at NODH4 was 14 mg/L on 13 Apr 2021 and exceeds the WDL 212-02 specified guideline values of 10 mg/L for the second consecutive quarterly monitoring event. As both ADP1 and NODH1 had TSS of < 5 mg/L on 13/04/2021, the exceedance at NODH4 is not a result of CIPS northern discharge. On the same day, TSS at SODH3 was 15 mg/L (> 10 mg/L WDL 212-02 guideline value). CIPS discharge is not a contributing factor this exceedance due to no flow at ADP2 and SODH1 at the time of sampling. For the rest of the sampling events, TSS concentrations were below the guideline value of 10 mg/L (WDL 212-02, 2020).

These exceedances were not required to notify NTEPA. Notifications are required only when (i) an exceedance of a trigger value on three consecutive sampling occasions or (ii) an exceedance of three times or more a trigger value as specified in the Water Monitoring Plan or Sediment Monitoring Plan (Condition 35, WDL 212-02).

Table A 3, Table A 4 and Table A5 in Appendix A provides results of Electrical Conductivity (EC), Turbidity and TSS at all monitoring sites, respectively. Biological Oxygen Demand (BOD) at all sites were in the range of 2 - 5 mg/L.

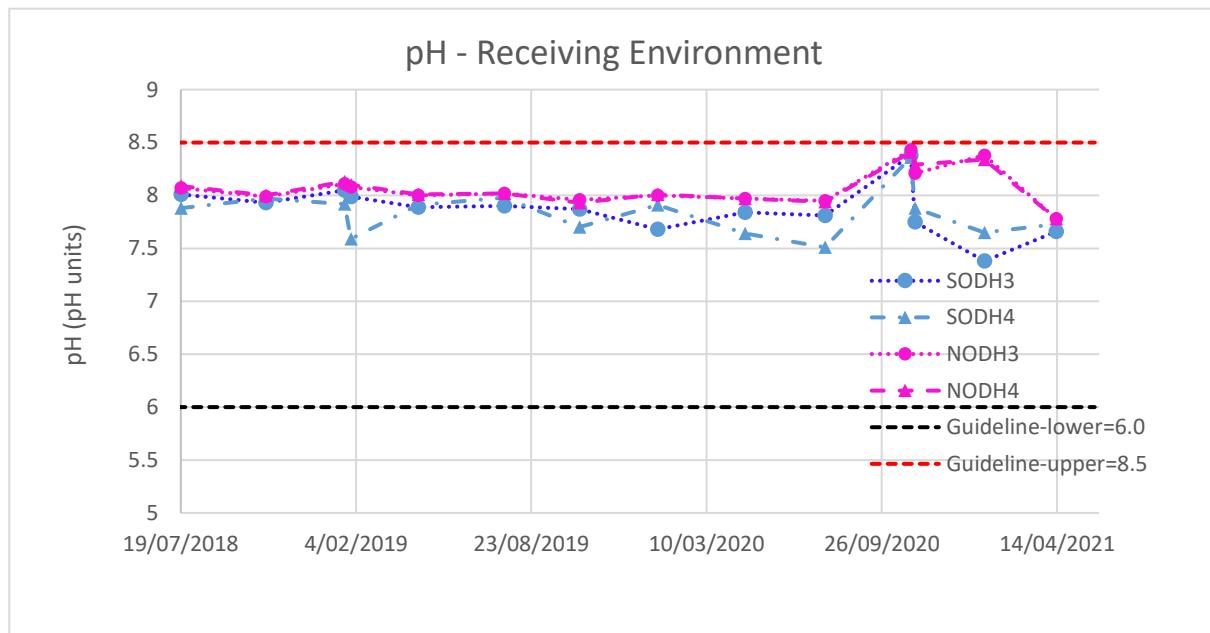

Figure 12: pH at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

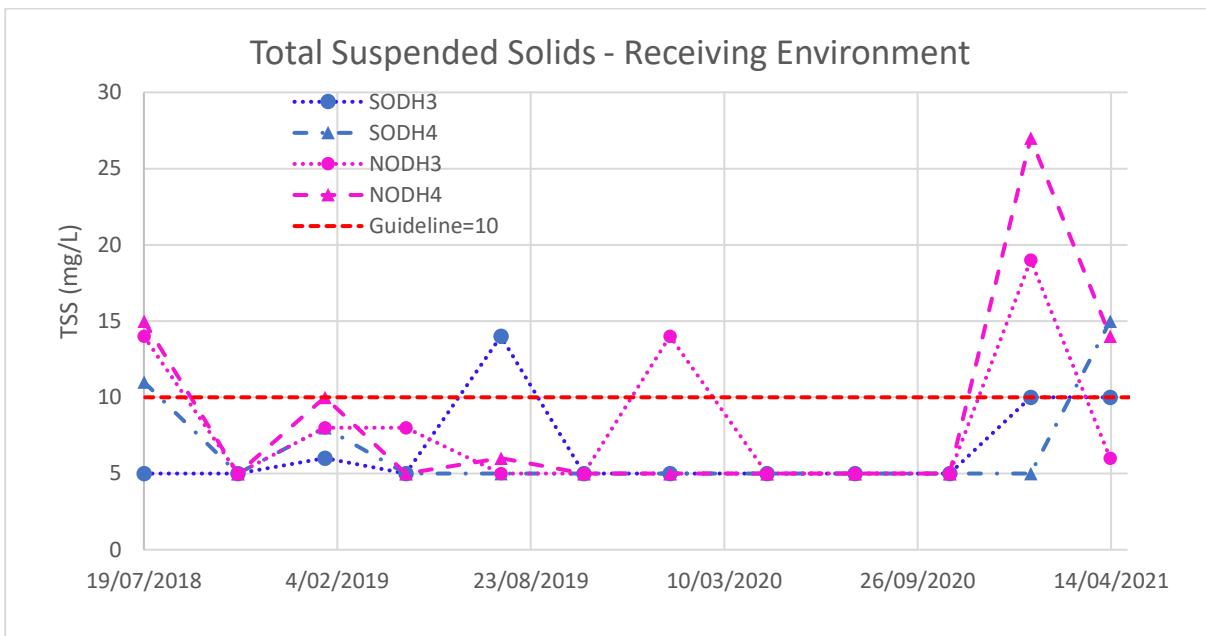

Figure 13: Total Suspended Solids (TSS) at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

3.1.3 Results of nutrient analysis

Figure 14 to Figure 16 show concentrations of Filterable Reactive Phosphorous (FRP), Total Phosphorous (TP) and Total Nitrogen (TN) at sites in the mixing zone/receiving environment (NODH3, NODH4, SODH3 and SODH4). The concentrations were compared with guidelines values specified in the WDL 212-02. The rest of the results are shown in Figure A3 to A5, Appendix A.

FRP and TP concentrations at all four sites were <0.005 mg/L or 0.005 mg/L (Figure 14 and Figure 15) during the reporting period. The FRP and TP concentrations are below the WDL 212-02 specified guidelines of 0.01 mg/L (FRP) and 0.03 mg/L (TP).

TN concentration at all four sites varied between <0.05 and 0.278 mg/L and are less than the guideline value of 0.30 mg/L (WDL 212-02, 2020).

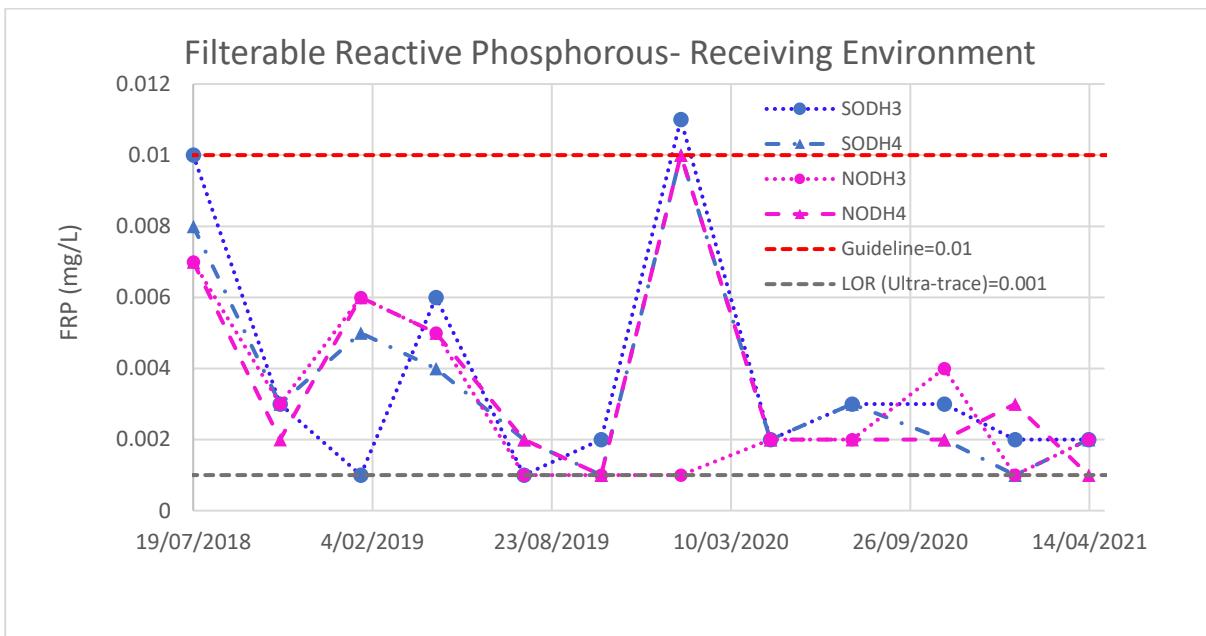

Figure 14 Filterable Reactive Phosphorous (FRP) concentration at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

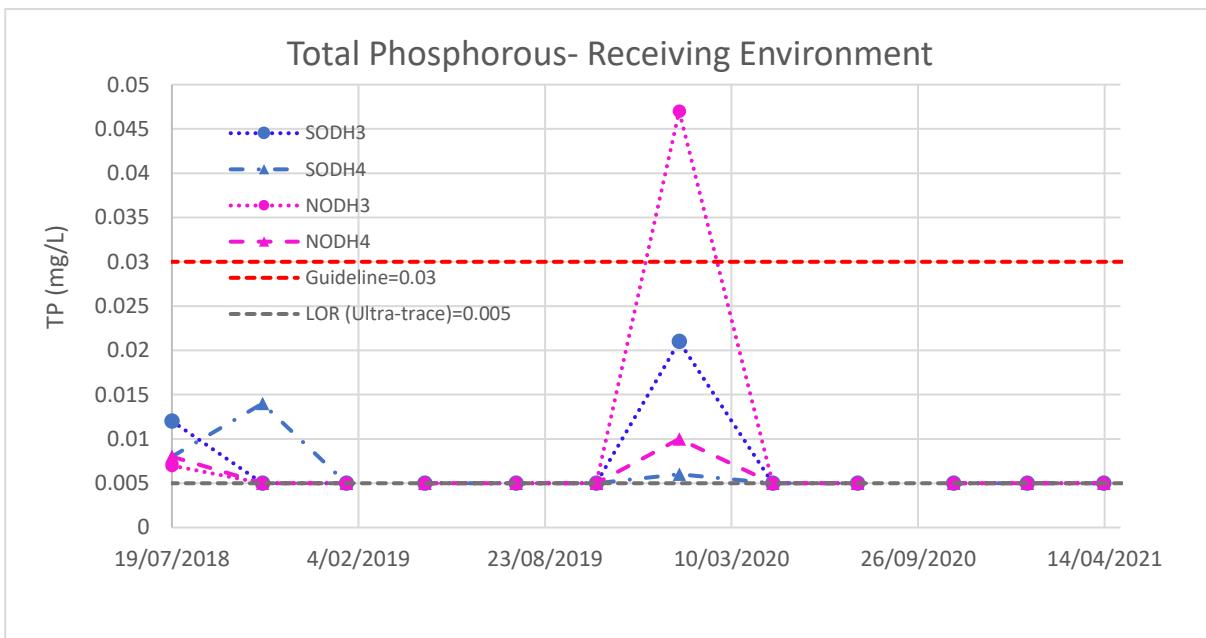

Figure 15 Total Phosphorous (TP) concentration at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

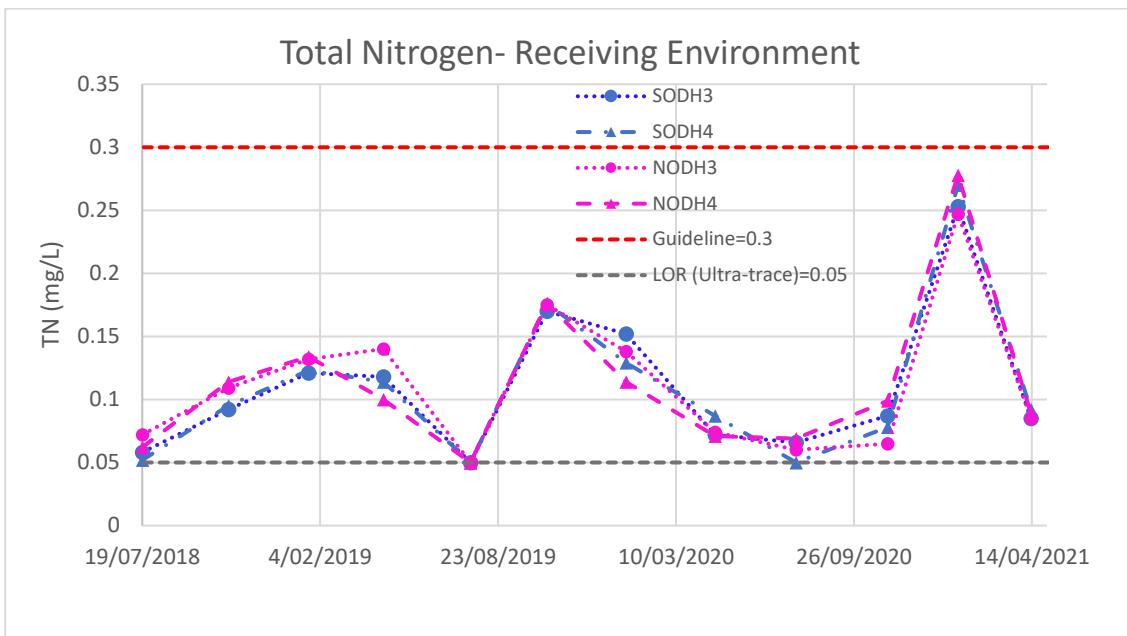

Figure 16 TN concentration at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

3.1.4 Results of metal analysis

Collected water samples were analysed for 11 metal elements as part of monitoring program and are shown in Table A6 and A7, Appendix A. Metal concentrations at all the sites situated in Darwin Harbour are below ANZECC/ARMANZ (2000b) guideline values for most of the cases, which indicate that there is no evidence of metal contamination in Darwin Harbour caused by metals in CIPS's discharged water through northern and southern outlets during the monitoring period. An incident of ANZECC/ARMANZ (2000b) trigger value exceedance can be seen at SODH3 on 22/01/2019 (previous reporting year) for Copper and Cobalt (Table A6). As a single exceedance these results are likely due to unknown factors and were not found on any other sampling occasion.

3.1.5 Results of microbiological analysis

E.coli concentrations at all the sites are given in Table A8, Appendix A. *E.coli* concentrations at CIPS discharge sites were highly variable across sampling events. The factors that would influence *E.coli* concentrations at sites SODH1 and NODH1 are stormwater runoff which carry microbes, the presence of cane-toads/birds around the sampling sites and sediment/sludge disturbances that could occur during sampling when the water flow is very low.

Figure 17 shows *E. coli* concentrations at Darwin Harbour sites SODH3, SODH4, NODH3 and NODH4. For most of the sampling events, *E. coli* concentrations at these sites were below the level of reporting. The highest recorded *E. coli* concentration was 26 MPN/100mL on 13/04/2021 indicating that the concentrations were well below the guideline value of 200 MPN/100mL (WDL 212-02, 2020).

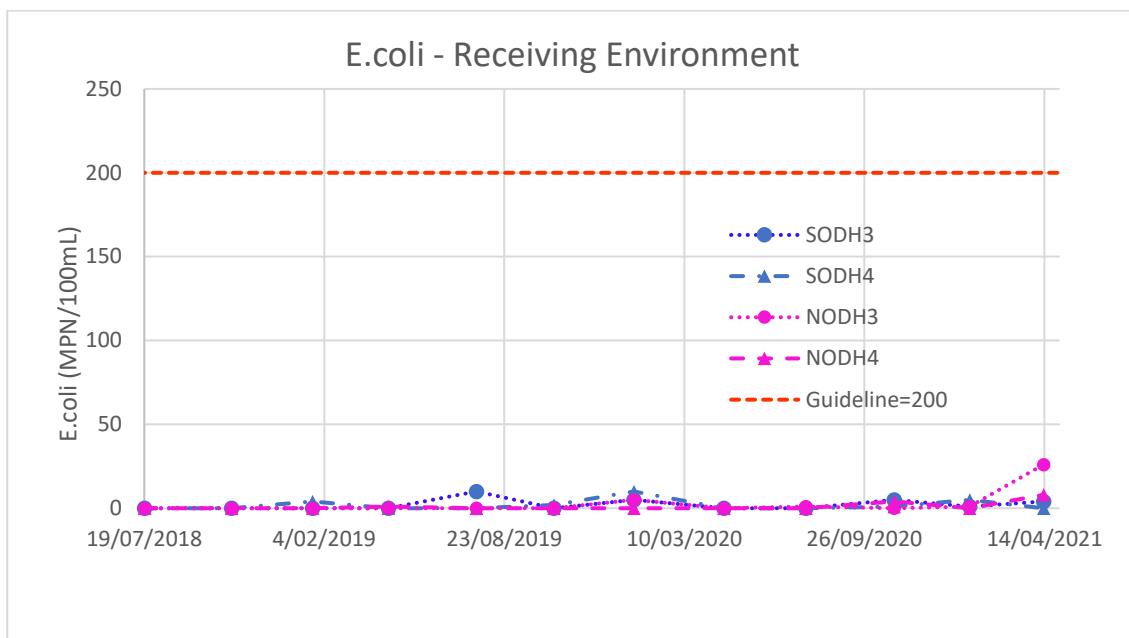

Figure 17: E.coli results (MPN/100mL) at sites in the mixing zone/receiving environment from July 2018 to April 2021 (Quarterly monitoring)

3.2 Sediment Monitoring Results

Sediment monitoring was conducted at sites NODH2 and SODH2 on quarterly basis. Laboratory results were compared with the ANZEC/ARMCANZ Interim Sediment Guidelines for environmental sediment monitoring (ISQG, 2000) or WDL 212-02 (WDL 212-02, 2020) trigger values when available.

3.2.1 Results of metal analysis

Metal concentrations of sediment at SODH2 and NODH2 are shown in Table 3 and Table 4 respectively. All the results for the current reporting year are below the ISQG (2000) specified guideline values indicating that water/sediment transport from the CIPS facility had not influenced metals concentrations in the sediment in Darwin Harbour.

Table 3: Sediment-Metal concentrations at SODH2 (Quarterly monitoring)

Metal	Aluminium	Copper	Lead	Nickel	Tin	Zinc	Arsenic	Cadmium	Chromium	Cobalt
Units	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg	mg/kg
LOR	50	5	5	2	5	5	5	1	2	2
ISQG trigger value-low	Develop SSTV	65	50	21	Develop SSTV	200	20	1.5	80	Develop SSTV
14/04/2016	16200	7	10	10	5	24	14	1	33	7

3.2.2 Results of hydrocarbon analysis

Total Petroleum Hydrocarbons (TPHs), Polycyclic Aromatic Hydrocarbons (PAHs) and BTEX (Benzene, Toluene, Ethylbenzene, Xylenes) concentrations at SODH2 and NODH2 were below the level of reporting (LOR) or equal to the LOR indicating no evidence of influence in Darwin Harbour sediment quality in terms of hydrocarbons contamination from CIPS discharge. Results are given in Table A 9 and Table A 10, Appendix A.

3.3 Flow Rates/Total Discharge

Wastewater discharge from ADP1 (cooling tower) which flows into the NODH1 were monitored and monthly average flow rate (kL/hr) is shown in Figure 18. The flow rate during the reporting period (since Apr 2020) varied from 0.6 kL/hr to 15.9 kL/hr. Total discharge from ADP1 for the past 14 months (Apr 2020 to May 2021) was also calculated and is 93.02 ML. As shown in Figure 18, there was an increase in monthly average discharge from ADP1, particularly since Feb 2021, compared to similar time in the previous year. Following are the reasons for this notable increase in discharge from ADP1.

- Boiler was offline. It reduced the evaporation rate and up-cycle program in the cooling tower. Hence, the water level in the cooling tower was increased and overflowed after reaching the set point level.
- Cooling tower was required to be online during this time to maintain the cooling process of the closed loop system.

Maintenance on the system monitoring has also been performed (e.g. makeup valve) at the time of reporting and TGen is expecting a reduced water discharge in the coming months. Reductions of ADP1 discharge during last two years were a result of the increased number of cycles the cooling tower undergoes before discharge of water, hence saving water and in turn reducing discharge volumes.

Figure 19 shows the monthly average flow rate at ADP2 which flows into SODH1. The total discharge for the reporting period (14 months) from the ADP2 was 13.04 ML. ADP2 discharge for current reporting period of 14 months (13.04ML) is less than the discharge for previous reporting period of 11 months (16.3 ML).

In total, CIPS has discharged 106.05 ML of wastewater for the 14 months period (Apr 2020 to May 2021).

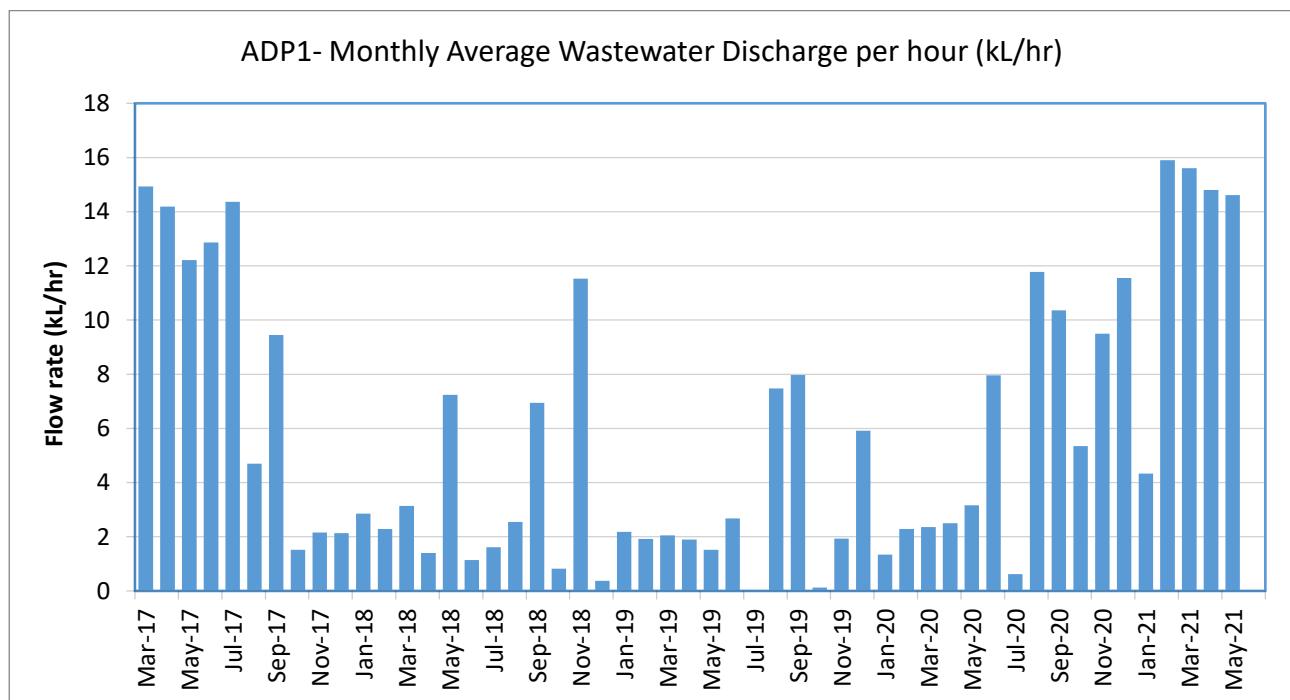

Figure 18: Monthly average wastewater discharge (kL/hr) from ADP1 (Cooling tower)

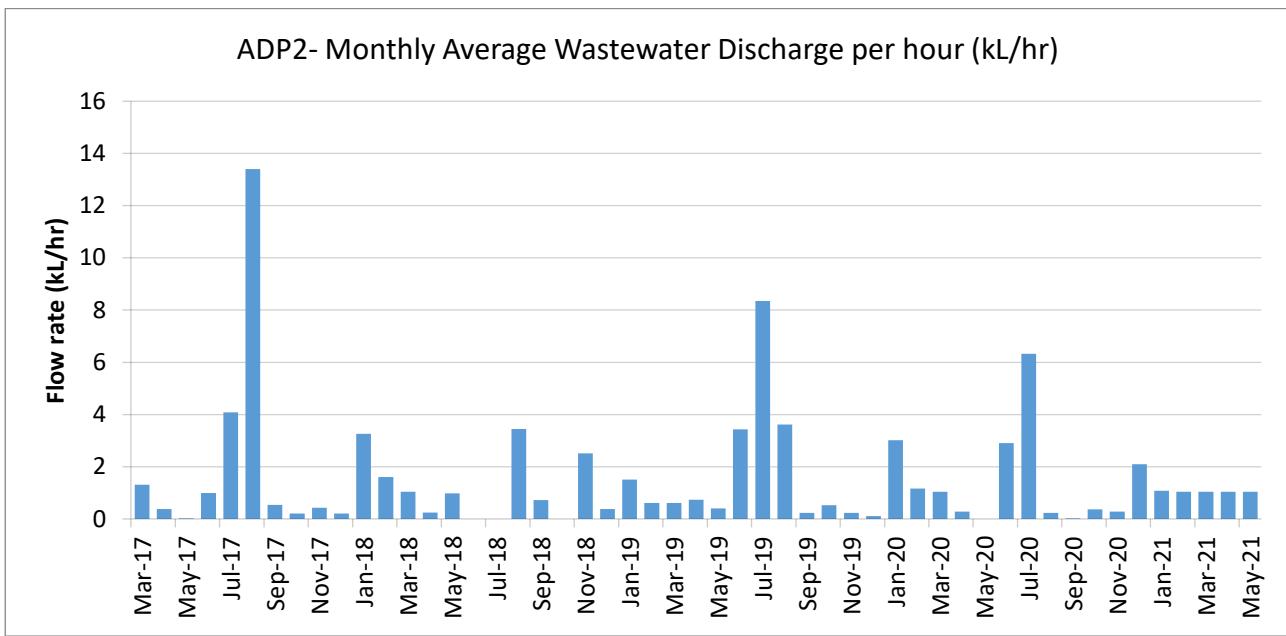

Figure 19: Monthly average wastewater discharge per hour from ADP2 (Cooling ponds outlet)

Given these discharge volumes, the influence on the Darwin Harbour is minimal with the inclusion of marine water. This was in fact evident with the results discussed above under the WDL 212-02 monitoring program.

4 CONCLUSIONS

Wastewater discharges from Channel Island Power Station (CIPS) and receiving water and sediment in Darwin Harbour were monitored in accordance with WDL 212-02 with the purpose of assessing preventing, reducing, controlling, rectifying, any environment harm resulting from wastewater discharged. This report primarily focused on the monitoring results of reporting period from April 2020 to May 2021. Data collected beginning in April 2016 is included in graphs and tables as found in Appendix A for easy reference to previous reporting periods.

The monitoring results from the receiving environment (Darwin Harbour) sites revealed that:

- There was no evidence for nutrients, metals and *E.coli* contamination at Darwin Harbour discharge mixing and receiving environment due to both southern and northern wastewater discharges from CIPS. All the nutrients, metals and *E.coli* concentrations at sites situated in the Darwin Harbour discharge mixing and receiving environment (NODH3, NODH4, SODH3 and SODH4) were below the trigger values defined in WDL 212-02, WQODH (2010) and/or ANZECC (2000).
- pH, Total Suspended Solids (TSS) and Dissolved Oxygen (% Saturation) were also within the specified guideline values at NODH3, NODH4, SODH3 and SODH4 except few occasional exceedances. These parameters are highly variable in the downstream sites due to external factors such as presence of oxygen demanding organic materials in the surrounding environment and tidal movements in Darwin Harbour. These exceedances are not non-compliances according to condition 35 of WDL 212-02.
- Metals and hydrocarbon concentrations of sediment at sites NODH2 and SODH2 were below the ANZECC/ARMCANZ Interim Sediment Quality Guideline values (ISQG, 2000) and the trigger values defined in WDL-212-02 (WDL 212-02, 2020).
- The total wastewater discharge volume from cooling tower and cooling ponds was 106.05 ML for 14 months period.

Based on the monitoring results for the reporting period, there was no evidence of impact resulting from wastewater discharged from CIPS on the Darwin Harbour receiving environment.
