ENVIRONMENT PROTECTION ACT 1970 (Vic)

STATEMENT OF ENVIRONMENTAL AUDIT

I, Jean Paul Pearce of Australian Environmental Auditors Pty Ltd, a person appointed by the Victorian Environment Protection Authority ('the Authority') under the Environment Protection Act 1970 ('the Act') as an environmental auditor for the purposes of the Act, having

1. been requested by Ms Sinead Redmond of HK Solutions on behalf of Department of Infrastructure, Planning and Logistics (DIPL) to issue a Certificate of Environmental Audit in relation to the site located at 47 Progress Drive, Nightcliff, Northern Territory – Lot B (Lots B1, B2 and B3) ('the site' shown in Figure 1), owned by the Northern Territory Government as a Department of Territory Families, Housing and Communities asset,
2. had regard to, among other things,
    i. guidelines issued by the Authority for the purposes of Part IXD of the Act,
    ii. the beneficial uses that may be made of the site,
    iii. relevant State environment protection policies/industrial waste management policies, namely,
        - SEPP (Air Quality Management)
        - SEPP (Ambient Air Quality)
        - SEPP (Waters)
        - SEPP (Prevention and Management of Contamination of Land)
        - Victorian Environment Protection (Industrial Waste Resource) Regulations 2009
3. in making a total assessment of the nature and extent of any harm or detriment caused to, or the risk of any possible harm or detriment which may be caused to, any beneficial use made of the site by any industrial processes or activity, waste or substance (including any chemical substance), and
4. completed an environmental audit report in accordance with section 53X of the Act, a copy of which has been sent to the Authority and the relevant planning and responsible authority.

HEREBY STATE that I am of the opinion that the site is suitable for the beneficial uses associated with:

- Sensitive use – High density;
- Public open space;
- Commercial use; and
- Industrial use,

subject to the following conditions attached thereto:

1. Asbestos containing materials (ACM) have been identified within fill materials on the external eastern site boundary for a portion of Lot B2. A geofabric marker layer has been installed along this portion of the site as shown in Figure 9 and extends from the surface to a depth of approximately 1.2 mbgl. This marker layer must be maintained until an Environmental Auditor determines that it is not required.
2. ACM have been identified in fill materials beyond the external site boundaries. Excavation crossing the site boundaries must not result in ACM contaminated fill being imported to the audit site.

The condition of the site is detrimental or potentially detrimental to any (one or more) beneficial uses of the site. Accordingly, I have not issued a Certificate of Environmental Audit for the site in its current condition, the reasons for which are presented in the environmental audit report. The terms and conditions that need to be complied with before a Certificate of Environmental Audit may be issued are set out as follows:

- ACM contamination in boundary soils would need to be cleaned up such that all relevant beneficial uses of soil are restored.

Other related information:

- ACM were found on the audit site and have been removed as far as reasonably practicable. No known ACM remains on the audit site. However, small quantities of ACM may remain within the soil and be uncovered during excavation works. These ACM fragments are not anticipated to represent a health risk to workers or occupiers of the completed development. If encountered during future development or use of the audit site, any fragments must be handled and disposed in accordance with the *Code of Practice How to Safely Remove Asbestos 2011* (or its relevant future revisions).
- Groundwater at the site contains naturally elevated concentrations of pH, cobalt, copper, nickel, lead, manganese and zinc. The levels are considered typical of the natural groundwater quality surrounding the site and do not constitute pollution in accordance with clause 10(2)(c) of State environment protection policy (Waters) 2018.
- If groundwater is to be extracted from the site, advice including testing, should be sought from a suitably qualified professional to ensure the groundwater is suitable for the intended use.
- Any material excavated from the site and disposed of off site should be classified and managed in accordance with IWRG 621 (or its relevant future revisions) or NT EPA equivalent. Analysis of fill materials should include asbestos and PFAS due to the previous on-site asbestos contamination and importation of fill materials from a Defence site;
- Not all land uses for which the land is considered suitable by this audit may be allowed under the existing zoning;
- A separate Environmental Audit Report and Statement of Environmental Audit will be issued for Lot A and another for the Road Reserve and Lot C; and
- In accordance with Section 53ZE of the Act, the owner/occupier of the site must provide a copy of this Statement to any person who becomes or proposes to become an occupier of the site.

This statement forms part of an Environmental Audit Report (Australian Environmental Auditors Pty Ltd, Environmental Audit Report (53X), 47 Progress Drive, Nightcliff, Northern Territory – Lot B (Lots B1, B2 and B3), AEA Ref: EA0729, Service Order No. PRL8565 (NTEPA2019/0099-199), 8 September 2022).

Further details regarding the condition of the site may be found in the environmental audit report.

DATED: 8 September 2022

Signed:

Jean Paul Pearce

Executive Summary

This report is in response to a request for a Certificate of Environmental Audit in accordance with Part IXD of the *Victorian Environment Protection Act 1970*. In accordance with EPA Victoria Publication 1147, summary information on this audit is presented in the following two tables.

Table 1: Summary of Audit Information

Item	Detail
Auditor	Jean Paul Pearce
Auditor account number	289162
Auditor appointment end date	26 November 2022
Audit type	53X
Date EPA notified of audit	21 November 2019
Audit service order number	PRL8565 (NTEPA2019/0099-199)
Name of person requesting audit	Ms Sinead Redmond Project Management Lead Northern Territory Department of Infrastructure, Planning and Logistics Land Development Unit
Relationship of person requesting audit to site	Authorised representative of the site owner
Name of premises owner	Department of Territory Families, Housing and Communities
Date of auditor engagement	20 November 2019
Completion date of the audit	8 September 2022
Reason for audit	Due to the identified pesticides and asbestos contamination, we understand EPA has required an Auditor to determine the site is suitable for use
Audit categorisation	Risk
Environmental segments	Air, Land, Groundwater, Surface water
If the audit was required by an EPA notice, licence or other, please provide EPA reference number	Not applicable
Current land use zoning	Zone MR (medium density residential), recently changed to Specific Use (SU) Zone SD49.
EPA region	Darwin
Municipality	Nightcliff
Dominant – Lot on plan	Lot 9077 Town of Nightcliff Lot 9077 has since been subdivided creating Lot 12840 (Lot B1), Lot 12842 (Lot B3) and Lot 12843 (Lot B2), refer to Attachment 1.
Additional – Lot on plan(s)	The project area has been split into three audit areas based on the proposed development. This audit is the second audit area (Stage 2 of 3 stages) and comprises three residential lots referred to as Lot B1, B2 and B3 (referred to as Lot B) Lot B is defined as Lot 12840 (Lot B1), Lot 12842 (Lot B3) and Lot 12843 (Lot B2), refer to Attachment 1.

Item	Detail	
Site/premises name:	John Stokes Square Nightcliff Development	
▪ Building/complex sub-unit No	-	
▪ Street/Lot – Lower No.	47	
▪ Street/Lot – Upper No.	-	
▪ Street Name	Progress	
▪ Street type (road, court, etc.)	Drive	
▪ Street suffix (North, South etc.)	-	
▪ Suburb	Nightcliff	
▪ Postcode	0810	
GIS coordinate of site centroid:		
▪ Latitude (GDA94)	-12.388587	
▪ Longitude (GDA94)	130.850751	
Site area (in square metres)	2,077 m^2 (Lot B1) 3,453 m^2 (Lot B2) 3,455 m^2 (Lot B3)	
Plan of site/premises showing the audit site boundary attached	Yes, refer to survey plan, Attachment 1.	
Plan of site/premises showing the audit site boundary attached in a spatial data format	No	
Members and categories of support team utilised	Shandel Coleman (AEA) for technical audit support Bridget Roder (AEA) for technical audit support	
Further works or requirements	No	
Nature and extent of continuing risk	Risks in groundwater have not been found to be significant, however the condition of the groundwater should be tested by an appropriately qualified environmental consultant (to determine the suitability thereof) prior to being utilised for extractive use. Risks in soil vapour have not been found to be significant. Risks in soil have not been found to be significant apart from residual ACM on the site boundary covered by a geofabric marker liner and slightly beyond the site boundary. This is not a risk to future site users, but excavation workers in the area should be aware of this. This is located within a PWC sewer easement and excavation works are therefore restricted to PWC accredited contractors who would be familiar with and have procedures in place to deal with asbestos finds.	
Outcome of the audit	Statement of Environmental Audit with conditions	
Has EPA determined CUTEP at this site?	No	
Has the auditor determined CUTEP at this site?	No	
Has a GQRUZ been identified at the site/beyond the site by EPA?	No	
Does NAPL remain at the site?	No – never encountered	
Please indicate which of the Protected Beneficial Uses of groundwater are precluded due to pollution	**Protected Use (Segment A1)**	**Precluded?**
	Water Dependent Ecosystems and Species	No
	Potable Water Supply (Desirable)	No

Item	Detail	
	Potable Water Supply (Acceptable)	No
	Potable Mineral Water Supply	n/a
	Agriculture and Irrigation (Irrigation)	No
	Agriculture and Irrigation (Stock Watering)	No
	Water-based Recreation (Primary Contact Recreation)	No
	Industrial and Commercial	No
	Traditional Owners Cultural Values (on-site)	n/a
	Cultural and Spiritual Values (on-site)	n/a
	Geothermal Properties	n/a
	Buildings and Structures	No

Table 2: Physical Site Information

Item	Detail
Historical land use	Residential
Current land use	Recently redeveloped for residential properties
Proposed future land use	High density residential
Surrounding land use – north	The police station (Lot A) north of Lot B1 and existing offsite residential north of Lot B2 and B3. Progress Drive then commercial, with low density residential beyond A service station is located to the north-east of the site
Surrounding land use – south	Proposed public open space (Lot C) Child care centre and tyre retailer then commercial A service station is located south-east of the site
Surrounding land use – east	Road Reserve, proposed residential (Lot B3), then Dick Ward Drive
Surrounding land use – west	Proposed residential (Lot B1), Lot A, vacant land and laneway then commercial
Proposed land use zoning	Specific Use (SU) Zone SD49
Nearest surface water receptor – name	Outer Estuary of Darwin Harbour
Nearest surface water receptor – direction	West
Likely point of groundwater discharge	Outer Estuary of Darwin Harbour, 160 m west of the site
Site aquifer formation	Unconsolidated soils
Groundwater flow direction	West
Groundwater TDS range (mg/L)	120 to 430 mg/L
Groundwater segment	Segment A1
Are there multiple aquifers impacted by pollution at the site?	No
Perched groundwater depth – upper (metres below ground level (mbgl))	n/a
Perched groundwater depth – lower (mbgl)	n/a
Regional groundwater depth – upper (mbgl)	6
Regional groundwater depth – lower (mbgl)	10
Number of bores within 2 km	46
Closest extractive use (distance in m)	Bore RN000130 (300 m from the site).
Zone of groundwater plume influence (m from site boundary)	Not applicable – non-source site
Year groundwater last monitored	2020
Have you attached electronic copies of Current Groundwater Analytical Results presented as a summary table?	Yes, refer to Appendix A

Read in Conjunction with Audit Report

This Executive Summary summarises the key points of the Audit Report. The Executive Summary must be read in conjunction with the full Audit Report (Service Order No. PRL8565 (NTEPA2019/0099-199); Australian Environmental Auditors Pty Ltd, ref. EA0729, *Environmental Audit Report (53X), 47 Progress Drive, Nightcliff* – Lot B (Lots B1, B2 and B3).

1 Introduction

1.1 Background

This Environmental Audit Report (EAR) and accompanying Statement of Environmental Audit (SEA) were prepared by Jean Paul Pearce, an employee of Australian Environmental Auditors Pty Ltd (AEA) and Environmental Auditor (Contaminated Land) appointed pursuant to the *Environment Protection Act 1970* (*Victorian EP Act*).

This EAR was prepared in response to a request from Ms Sinead Redmond, a project manager for Department of Infrastructure, Planning and Logistics (DIPL) to conduct an environmental audit of the site under section 53X of the *Victorian EP Act* to satisfy an NT EPA requirement.

DIPL contracted Greencap Pty Ltd (Greencap), Agon Environmental Pty Ltd (Agon) and SLR Consulting Australia Pty Ltd (SLR) to undertake environmental site investigations and remediation for the purpose of providing sufficient information to allow this audit to be completed.

This EAR has been prepared in accordance with Section 53X of the *Victorian EP Act* and relevant Victorian and Northern Territory EPA guidance (particularly EPA Victoria Publications 759 and 1147). The SEA has been prepared in accordance with Section 53Z of the *Victorian Environment Protection Act 1970* and relevant Victorian and Northern Territory EPA guidance (particularly EPA Victoria Publication 759).

1.2 Site Definition

The site subject to this environmental audit is identified as 47 Progress Drive, Nightcliff, Northern Territory – Lot B comprising Lots B1, B2 and B3 (the site), and is 0.90 hectares in area. Further details are provided in Table 1.

The project area has been split into three audit areas based on the proposed development. This audit is the second audit area (Stage 2 of 3 stages) and comprises three residential lots referred to as Lot B1, B2 and B3 (referred to as Lot B). The boundaries are shown in Attachment 2.

A separate audit report has been prepared for Lot A (police station) which has been constructed (audit report dated 31 March 2022). The remainder of the project area comprises Lot C and the Road Reserve, this stage of work will be documented in a separate audit report (currently pending). These areas are currently being redeveloped.

The site is located approximately 8 km north of the Darwin central business district, Northern Territory. The site location is shown in Attachment 1, the certificate of title is included in Appendix B and a plan showing the boundaries of the site and the audit areas is provided as Attachment 2. Note that the certificate of title reflects the original Lot boundaries, as the certificates of title for the new Lots (B1, B2 and B3) allotments are not available at this time.

1.3 Proposed Development

The site is currently being redeveloped for high density residential use. A plan showing the proposed residential development is provided as Attachment 2.

The proposed development is consistent with *Residential* under the Land SEPP. Surrounding uses are a mix of sensitive use (existing residential), commercial and industrial.

1.4 Reason for the Environmental Audit

The audit of the site was completed to meet NT EPA requirements. Due to the identified pesticides and asbestos contamination, we understand EPA has required an auditor determine the site is suitable for use. The audit included assessing the site with regard to historical activities potentially impacting on beneficial uses. The Auditor considered the site conditions relative to the proposed use and assessed the suitability

of the site for the proposed use, as well as all potential protected beneficial uses, as required by EPA guidelines.

1.5 Independence of the Environmental Auditor

The environmental audit system depends on the Auditor undertaking an independent assessment of the site condition and risks to beneficial uses. EPA guidelines provide guidance on the Auditor maintaining their independence and avoiding potential conflicts of interest.

To the best of the Auditor's knowledge, the Auditor and his support team have had no involvement with this site prior to this audit. The Auditor and his support team have no financial association with the consultant or client beyond the payment for audit services by the client. Based on EPA guidance, the Auditor is therefore not aware of any real or perceived conflicts of interest which should prevent the audit from being completed.

2 Audit Framework and Scope of Works

2.1 General

The *Victorian EP Act* defines an environmental audit as a *'total assessment of the nature and extent of any harm or detriment caused to, or the risk of any possible harm or detriment which may be caused to, any beneficial use made of any segment of the environment by any industrial process or activity, waste, substance (including any chemical substance) or noise'.*

The segment of environment for the purposes of an environmental audit (contaminated land) is the audit site which is defined in terms of *'a parcel of land and all other elements (i.e. land, groundwater, surface water, air) of the environment associated with the land within the boundary of the parcel of land'* (Victorian EPA Publication 759).

A beneficial use is defined in the *Victorian EP Act* as '*a use of the environment or any element or segment of the environment which –*

(a) is conducive to public benefit, welfare, safety, health or aesthetic enjoyment and which requires protection from the effects of waste discharges, emissions or deposits or of the emission of noise; or

(b) is declared in State Environment Protection Policy to be a beneficial use;'

Furthermore, a beneficial use is considered relevant *'if the beneficial use is existing or is likely to be realised at the site'* (Victorian EPA Publication 759).

The assessment of whether a specific beneficial use is precluded or not is undertaken using an assessment of site condition against published qualitative and quantitative assessment criteria.

If the contamination status of the site is not detrimental to any beneficial use, then the outcome of the environmental audit will be a Certificate of Environmental Audit (CEA), in which case there is no restriction on the use of the site due to its contamination status.

If the contamination status of the site is detrimental to any beneficial use, then the outcome of the environmental audit will be an SEA, which indicates that the site is either:

- Not suitable for any use;
- Suitable for specific uses (that is, not detrimental to the beneficial uses associated with the nominated land use) without conditions or limitations; or
- Suitable for specific uses (that is, not detrimental to the beneficial uses associated with the nominated land use) subject to conditions and/or limitations relating to its use and management.

2.2 Legislation, Regulations and Guidelines

Section 68 of the Northern Territory Waste Management and Pollution Control Act 1998 (WMPC Act), Register of qualified persons, specifies that:

(1) The NT EPA must cause to be established and maintained a register of:

(a) persons qualified to perform environmental Audits for the purposes of an environmental Audit program…

It is understood that in early 2011 persons accredited under the NSW Site Auditor Scheme or the Victorian Environmental Auditor Scheme were approved as a class of person suitable to undertake environmental Audits in the Northern Territory.

The Audit was undertaken in accordance with Section 47d of the WMPC Act which states in part that:

An environmental Audit is an evaluation of any of the following:

(d) the likelihood of waste management problems or pollution resulting in environmental harm occurring and the adequacy of safeguards in place to prevent their occurrence or limit their impact on the environment;

(f) the types, amount, distribution or mobility of contaminants or waste present in the environment.

When conducting this environmental audit, the following key pieces of legislation (and subordinate legislation) were considered:

- *Environment Protection Act 1970* (Act No. 8056/1970) Victoria;
- SEPP (State Environment Protection Policy) (1999) *Ambient Air Quality*. Victorian Government Gazette, S19, 9 February 1999;
- SEPP (State Environment Protection Policy) (2001) *Air Quality Management*. Victorian Government Gazette, S240, 21 December 2001;
- SEPP (State Environmental Protection Policy) (2002) *Prevention and Management of Contamination of Land*. Victorian Government Gazette, S95, 4 June 2002; and
- SEPP (State Environmental Protection Policy) (2018) *Waters.* Victorian Government Gazette, S499, 23 October 2018.

Key guidance documents for environmental auditing include, but are not limited to, the following:

- NT EPA, *Guideline for the Preparation of an Environmental Management Plan*, May 2015;
- NT EPA, *Northern Territory Contaminated Land Guideline,* June 2017;
- EPA Victoria Publication 865.12, *Environmental Auditor Guidelines for Appointment and Conduct*, December 2016;
- EPA Victoria Publication 952.5, *Preparation of Environmental Audit Reports on Risk to the Environment*, December 2015;
- EPA Victoria Publication 953.2, *Environmental Auditor Guidelines for Conducting Environmental Audits*, August 2007; and
- EPA Victoria Publication 1147.2, *Environmental Auditor Guidelines – Provision of Environmental Audit Reports, Certificates and Statements*, December 2015 and its replacement Publication 2022, *Environmental Auditor Guidelines – Provision of Statements and Reports for Environmental Audits and Preliminary Risk Screen Assessment*, August 2021.

Additional guidance documents include, but are not limited to, the following:

- ASC NEPM (2013) National Environment Protection (Assessment of Site Contamination) Measure 1999 (ASC NEPM), as amended May 2013, National Environment Protection Council. Australian Government;
- WA DoH (2021) Guidelines for the Assessment, Remediation and Management of Asbestos Contaminated Sites in Western Australia, Department of Health;
- HEPA (2020) PFAS National Environmental Management Plan (NEMP), Heads of EPAs Australia and New Zealand;
- CRC CARE 'Technical Report 16: Safe onsite retention of contaminants Part 2: A risk based approach' (2013); and
- ANZECC (Australian and New Zealand Environment and Conservation Council), Guidelines for the Assessment of On-Site Containment of Contaminated Soil, September 1999.

The NT EPA requirements for summary information are provided in the Executive Summary.

The EPA requirements for summary information are provided in Appendix A, including:

- A completed Pro Forma for the Completion and Issue of Statement or Certificate of Environmental Audit, as per Appendix 9 of EPA Publication 759;
- A site survey plan; and
- A summary of current groundwater analytical results as per Attachment C of EPA Publication 840.

The Victorian *Environment Protection Act 2017* commenced on 1 July 2021, replacing the *Environment Protection Act 1970* and Vic EPA publications have been in a state of preparation and revision since then to help industry comply with the new Act. Victorian EPA Publication 1978 *Transition guidance for environmental auditors*, June 2021, provides guidance to Auditors on how to manage the transition of the new Act for their audits. An email from the Victorian Environmental Audit Unit on 26 October 2021 noted the extension of transition arrangement until October 2022. Effectively, audits commenced under the 1970 Act can be completed in accordance with that Act at any time (preferably by October 2022) or can be completed under the new Action from 1 July 2021. The site investigations were largely completed prior to 1 July 2021 and following discussions with NT EPA, it was agreed to complete the audit under the old Act. It is noted that science and technical publications upon which the Auditor determines site suitability have not changed.

2.3 Audit Scope

2.3.1 Previous Environmental Audits

The project area has been split into three audit areas based on the proposed development. This audit is the second audit area (Stage 2 of 3 stages) and comprises three residential lots referred to as Lot B1, B2 and B3 (referred to as Lot B). A separate audit report has been prepared for Lot A (dated 31 March 2022), and the final audit report to be prepared is for the remainder of the site which includes Lot C and the Road Reserve.

2.3.2 Reports Reviewed

The following documents were finalised prior to commencement of the audit, and were reviewed primarily for background purposes:

- Greencap, *Limited Soil Investigation, John Stokes Square, 47 Progress Drive, Nightcliff,* 14 July 2019;
- Greencap, *Detailed Site Investigation, John Stokes Square, 47 Progress Drive, Nightcliff,* draft 2 September 2019;
- Greencap, *Additional Soil Investigation, John Stokes Square, 47 Progress Drive, Nightcliff,* October 2019;
- Greencap, *Asbestos Management Plan, John Stokes Square, 47 Progress Drive, Nightcliff,* October 2019;
- WANT Geotechnics Pty Ltd, *Geotechnical Investigation, Proposed Redevelopment of John Stokes Square, Lot 9077 Progress Drive, Nightcliff,* 23 October 2019; and
- Agon Environmental, *RE: John Stokes Square – Environmental Summary,* 25 October 2019

The following documents were provided to the Auditor for review and comment during the audit period, and were subsequently revised to meet auditor requirements (only the final versions are listed below):

- Agon Environmental (2020a), *Detailed Site Investigation, John Stokes Square, 47 Progress Drive, Nightcliff, NT* (Ref JF1006.DSI/Final, 21 April 2020;

- SLR (2020a) *Memorandum: Remediation Strategy, John Stokes Square – Residential Lots (Lots B1, B2 and B3)* (Ref.680.10679.00000-M04-v2.0 20200603, 3 June 2020)
- SLR (2020b) Sampling, Analysis and Quality Plan, Detailed Site Investigation, John Stokes Square (ref. 680.10679-R01-v1.0, 3 June 2020)
- Halikos (2020), *Construction Environmental Management Plan Revision 2.0, John Stokes Square, Broad Scale Site Remediation and Construction Preparation Works* (Ref PMP-3.03 Rev3, June 2020).
- Greenspace Group (2020) Construction Environmental Management Plan (Ref. T20-1056 V1, 5 July 2020)
- SLR (2022a) *Sewer Easement Remediation and Validation Report – John Stokes Square Redevelopment, Residential Allotments B1, B2 and B3* (ref. 680.10679.00200-R13 V1.0, dated 14 January 2022)
- SLR (2022b) *Validation Report – John Stokes Square Redevelopment, Proposed Residential Lots B1, B2 and B3* (ref. 680.10679.00100-R05 V4.0, January 2022)

A copy of both Validation Reports (2022a and 2022b) are provided in Appendix C.

A review of the above reports did not identify reference to any relevant reports that have not been provided for review by the Auditor.

2.4 Correspondence with Client and their Consultants

During the audit, the Auditor issued a series of formal review letters to the client and their consultant. These letters typically document the outcome of the Auditor's review of work plans and draft reports. A copy of the Auditor's letters is provided in Appendix D.

In addition, the Auditor also provided numerous e-mails to the client and consultant. Copies of these documents are held with AEA.

2.5 Correspondence and Liaison with EPA

The Auditor submitted a *Notification of Request to Issue a Certificate of Environmental Audit* to the EPA on 22 November 2019. A copy is provided in Appendix D.

The Auditor corresponded with NT EPA regarding the use and reporting against the 1970 Victorian EP Act as per e-mail dated 8 November 2021.

A copy of the draft audit report and statement were provided to EPA on 24 August and EPA comments provided on 30 August were taken into consideration when finalising this audit report.

2.6 Audit Team and Expert Support

The Auditor consulted with the following expert support team:

- Shandel Coleman, Principal Environmental Scientist – project management, review of assessor's reports and sampling plans and draft audit reporting; and
- Bridget Roder, Senior Environmental Engineer – project management, review of assessor's reports and sampling plans and draft audit reporting.

2.6.1 Site Inspections

A summary of the site inspections and pertinent observations is provided in Section 4.

2.7 Auditor's Verification of Site Conditions

The Auditor has undertaken work to verify that the environmental activities and quality of the site is as reported by the various reports reviewed.

The Auditor and/or his assistant undertook site inspections via video conference and physically to:

- familiarise with the site and surrounding area;
- verify observations noted by the consultant;
- observe a portion of the remediation work; and
- confirm final site condition.

A number of site inspections were undertaken via video conference due to COVID-19 travel restrictions which were in place during the majority of the project. Final site inspections were undertaken by the Auditor in person on 28 October 2021 and the Auditor's Assistant in person on 24 July 2022.

The Auditor considered that verification sampling was not necessary to complete the audit. This determination was made based upon:

- the lack of unexpected or unexplained pollution;
- the competency of the consultant who conducted the sampling and the laboratories which conducted the analysis;
- the quality of the documentation provided by the consultant and laboratories; and
- the verification between consultant's documentation and site observations by the audit team.

2.8 Uncertainties of the Audit Process

This audit report has been prepared for the client for the purposes described in the audit report. This document may not be suitable for other purposes.

The Auditor has prepared this document in good faith, but is unable to provide certification outside of areas over which he had some control or is reasonably able to check.

It is not possible in an Environmental Audit Report to present all data, which could be of interest to all readers of this report. Readers are referred to the referenced investigation reports for further data. Users of this document should satisfy themselves concerning its application to, and where necessary seek expert advice with respect to, their situation.

The Auditor notes that any comments and conclusions provided in this document regarding the suitability of the site for the proposed land use are implicitly limited to consideration of contamination related issues as defined under the *Victorian EP Act*.

3 Site History and Characterisation

3.1 Site History Summary

Site history information was provided primarily from Agon DSI (2020a). Aerial photography showed that until between approximately 1944 and 1969 the site was native bushland which was subsequently cleared. In 1969 the site had been cleared of vegetation but remained undeveloped, however significant residential development and road infrastructure had occurred to the north of the site. From 1969 land surrounding the site continued to be developed for residential and commercial use. The site was most recently (from the 1980s until 2019) used for high density residential use. Demolition occurred in late 2019.

In December 1974 Cyclone Tracy devastated the city of Darwin destroying buildings and infrastructure across the city (and greater Darwin region). The destruction of buildings resulted in the spread of asbestos debris, resulting in its presence within surface soils across Darwin. Based on the timing of development of the site, it is possible that legacy asbestos debris is present in fill on site associated with Cyclone Tracy.

Based on historical aerial photographs, the Auditor considers that the structures visible in 1974 were potentially constructed using asbestos cement and the bonded asbestos identified in soils may also have originated from the demolition of structures prior to 1990 or importation of asbestos contaminated fill.

No other evidence of point sources of contamination or significant contaminating activities were identified at the audit site, such as underground fuel storage tanks or industrial activities.

The site history identified the following off-site land uses that have potential relevance to the audit:

- Service stations located to the north-east, east and south-east of the site; and
- Other surrounding properties comprised a mix of residential and commercial purposes, and mostly low risk of being a source of significant contamination (uses included supermarket, newsagency, post office, hairdresser, restaurants).

3.2 Potential Contamination Sources and Contaminants of Concern

The Auditor considers that the key on-site potential contaminants of concern and likely location for the site include:

- Historical application of pesticides/herbicides such as termiticides;
- Historical use of ACM construction materials; and
- Imported fill across the site (heavy metals, total recoverable hydrocarbons [TRHs], polycyclic aromatic hydrocarbons [PAHs], asbestos, pesticides).

Attachment 3 shows the former site layout.

The Auditor considers that the key potential contaminants of concern from the off-site sources include:

- Service stations with underground fuel storage tanks (USTs), located to the north-east, east and south-west of the site (TRHs, benzene, toluene, ethylbenzene and xylenes [BTEX], PAHs); and
- Urbanisation, sewage disposal and management (nitrate and ammonia).

The results of the site history investigation indicate that the site is a potential source of contamination, particularly in shallow soil/fill. The site history also determined there are potential off-site sources of contamination which may be impacting on the site, particularly groundwater.

3.3 Adequacy of Site History Information

Table 3: provides information on the site history information sources investigated and adequacy for the audit purpose.

Table 3: Adequacy of Site History Information

Information Requirements	Undertaken	Auditor's Comments
Land uses (previous and current)	Yes	Historical certificates of title, historical aerial photographs and other sources were reviewed to obtain this information and were documented in the consultants' reports.
Owners, occupiers and users (previous and current)	Yes	Historical certificates of title were reviewed to obtain this information and were documented in the consultants' reports.
Current and historical title search	Yes	Reviewed back to 1986 (original title).
Historical aerial photographs for the Site and adjacent properties	Yes	Historical aerial photographs (1944, 1969, 1974, 1985, 1990, 2001, 2012 and 2019) reviewed by Agon.
Environmental Audit Reports and Statements and Certificates for site and surrounding area	Yes	A search of the NT EPA's Contamination Register was documented in the consultants' reports.
Landfill Register	Yes	There is no NT EPA register. The Auditor undertook a review of landfills in the area. No landfills were identified within 500 m of the site.
Unexploded Ordnance (UXO)	Yes	The Auditor undertook a review on the Department of Defence online UXO map and the site and surrounds were not identified as having a potential for UXO.
Groundwater database review	Yes	Agon undertook a search for groundwater data near the site using Northern Territory Groundwater Data Portal, documented in the consultants' reports.
Local planning scheme and environmental overlays	Yes	Documented in consultant's report.
Search of dangerous goods register	No	Formerly residential land use, no storage of dangerous goods expected.
Review of asbestos register (if applicable)	No	No asbestos register available. Asbestos identified in soils and remediation undertaken.
Interviews with person knowledgeable with the site	No	Formerly residential land use, no notable activities expected.
Detailed site inspection	Yes	Numerous site inspections undertaken.
Chemical inventory and storage details (including USTs)	No	Formerly residential land use, no storage of chemicals expected.
Review of previous investigations and critique on adequateness of data	Yes	Documented in consultant's DSI report and undertaken by the Auditor.
Chronological list of land use activities including potential information gaps and uncertainties	Yes	Documented in the consultant's report.
List of potential contaminating activities, likely contaminants and locations	Yes	Documented in the consultant's report.
Potential off-site sources of contamination identified	Yes	Documented in the consultants' reports.

Information Requirements	Undertaken	Auditor's Comments
Site plan showing historical site layout (if relevant)	Yes	Documented in the consultant's report.
Environmental setting (i.e. nearby ecological receptors)	Yes	Documented in the consultant's report.
Local geology and hydrogeology	Yes	Documented in the consultant's report.
Potential for acid sulfate soils	Yes	Documented in the consultant's report.

Based on the information provided, the Auditor considers that the site history investigations have been generally undertaken with regard to relevant legislations and guidelines. The Auditor notes that the data gaps identified in the above table and those inherent within site history investigations have been adequately addressed through broad screen analysis of both soil and groundwater, and excavation of surface soils across the entire site.

The Auditor considers that there is sufficient site history information to provide a suitable level of confidence regarding the historical uses of the site as they relate to the potential for contamination and to inform the requirements for detailed site investigations. The Auditor therefore considers the site history investigations as adequate.

4 Site Characterisation

4.1 Site Description and Observations from AEA Site Inspections

At the time of the Auditor's initial site inspection on 28 January 2020, the site had been cleared of structures with crushed concrete present on Lot B. The former site layout is shown in Attachment 3.

At the final site inspection on 24 July 2022, the residential properties on Lots B1, B2 and B3 were under construction with the superstructure commenced and the landscaping pending. The on-site road next to the Lot B allotments was completed and landscaping of the verge was complete. The construction of the police station in Lot A had been completed.

The Auditor undertook several site inspections over the course of the audit. Due to the travel restrictions from COVID 19, a number of the site inspections were undertaken via video conference or using a local representative. A summary of the key observations is provided in Table 4: below.

Table 4: Summary of Auditor Inspections

Date	Reason for Inspection	Observations
28 January 2020	Initial inspection and meeting with client and consultant to observe site condition	Site vacant and structures demolished. Isolated fragment of potential bonded ACM in good condition. Crushed concrete evident on Lot A with no surface ACM observed. No visual or olfactory indicators of staining. Groundwater wells in situ with no hydrocarbon odours evident. Inspection of surrounding area did not identify groundwater monitoring wells on public land. With the exception of potential ACM, no other indicators of contamination identified.
11 June, 6 August, 14 and 19 October 2020	Video inspections to observe civil/remediation works in progress	Observe remediation works across the general area associated with civil works, including removal of redundant underground services across the wider site and boundary asbestos to the north-east (Lot B). Observations consistent with SLR reporting.
12 August 2021	Video inspection and in person by Chris Gamble of Agon to observe management of unexpected finds	Wider site under construction with civil works and ad hoc asbestos removal occurring within Road Reserve via unexpected finds protocols. Police station structure completed and Lot A fully covered by concrete. Inspection report provided in Appendix D.
28 October 2021	Final site inspection – in person by the Auditor	Construction of the police station (Lot A) was complete with Lot A fully covered by concrete. Construction of the residential apartments with slab installed and awaiting fit-out and landscaping. Boundary works completed. Construction of road partially completed with landscaping in the verge underway. No potential ACM or other visual or olfactory indicators of contamination observed.
24 July 2022	Final site inspection – in person by the Auditor's Assistant	Construction of the police station (Lot A) was complete with Lot A fully covered by concrete. Construction of the residential apartments with superstructure commenced and landscaping pending (Lots B1, B2 and B3). Boundary works completed. Construction of road, car park and landscaping in the verge complete. No potential ACM or other visual or olfactory indicators of contamination observed.

4.2 Surrounding Land Uses

The surrounding land uses are as follows:

1. North: Lot A (police station) and existing off-site residential, Progress Drive then commercial with residential properties north-east.
2. East: Residential properties and a Coles Express service station then Dick Ward Drive.
3. South: Lot C public open space under development, existing childcare centre and tyre retailer and Caltex service station to the south-east.
4. West: vacant land then commercial.

4.3 Council Planning Scheme

The site was located within a medium density residential zone (SD – Single Dwelling) under the Northern Territory Planning Scheme. During development of the site the zoning was changed to Specific Use (SU) SD49; the purpose of this zone is to facilitate development of the land for a complementary mix of commercial, community and residential uses in mixed use multistorey buildings with high amenity public areas.

4.4 Topography and Surface Waters

The site surface elevation drops approximately 3 m from the north-east corner to the south-west corner towards Darwin Harbour.

There are no on-site surface water bodies. Significant surface water is not expected to enter the site from neighbouring properties or streets.

The site is located approximately 160 m from the edge of a mangrove community and the Outer Estuary of Darwin Harbour to the west of the site.

4.5 Geology and Hydrogeology

4.5.1 Regional Geology

A review of the 2.5 m Geological Map indicates the local geology at the site comprises Cretaceous Aged Sedimentary mudstone and shale deposits and is indicated to be underlain by pisolitic and nodular laterite gravel.

4.5.2 Site Geology

Intrusive investigations indicated the soil at the site consisted of a heterogeneous fill layer up to 0.8 m deep, comprising sandy clay, sandy gravelly silts and clayey silty sand. Natural lateritic soils consisted of red brown and yellow clayey sandy gravel overlying stiff to very stiff red brown sandy clay with trace gravels, underlain by highly weathered siltstone to a maximum of 3.8 mbgl with very low strength siltstone to the maximum depth of investigation (5.6 mbgl).

A review of the *Atlas of Australian Acid Sulfate Soils* (CSIRO) indicates the south-western corner of Lot A, closest to the marine environment, has a greater probability of encountering Acid Sulfate Soils (ASS) than the remainder of the site (high probability compared to extremely low probability). Test pitting did not encounter any soils typically associated with lowland coastal environments.

4.5.3 Regional Hydrogeology

No water quality data was available within proximity to the site. Regional groundwater flow is likely to be to the west to south-west, towards Darwin Harbour (Beagle Gulf).

4.5.4 Registered Bore Search and Current Extractive Uses

A 2 km radius bore search was undertaken by Agon using *Northern Territory Government Water Data Portal*, and this was cross-checked by AEA. The Agon search identified 46 registered bores, with seven bores within a 500 m radius. One bore was listed as being used for production and the remainder for investigation or unknown purposes.

The nearest production bore (RN000130) was located approximately 300 m east of the site, likely up-gradient to cross-gradient. None of the bores were inferred to be located down-gradient of the site.

Based on the available information, it is possible that groundwater is being used for domestic purposes, such as watering gardens, in the vicinity of the site, however the Auditor considers potential use to be limited, due to the availability of mains water and highly urbanised land use.

4.5.5 Site-specific Hydrogeology

The TDS concentration of groundwater recovered on the site ranged from 120 to 430 mg/L, classifying the groundwater as Segment A1.

Stabilised depths to groundwater were approximately 2.7 to 3.8 m below top of casing (mbtoc). Groundwater flow direction was not determined as the groundwater monitoring wells were not surveyed.

The regional flow direction is expected to be towards the nearest potential discharge point at Outer Estuary of Darwin Harbour (approximately 160 m from the site).

4.6 Conceptual Site Model

4.6.1 General

A written preliminary conceptual site model (CSM) was prepared by Agon (2020a), which provided an assessment of preliminary site conditions against the essential elements of a CSM, as stated in Section 4.3 of Schedule B2 to the ASC NEPM. A diagrammatic representation of the CSM was also provided by Agon (reproduced as Attachment 6). The following sections provide the Auditor's summary and interpretation of the CSM.

The CSM was updated throughout the investigation and remediation phases of work by SLR. The post remediation CSM is detailed in Section 4.6.8.

4.7 Known and Potential Sources of Contamination

The primary potential sources of contamination are the historical application of pesticides/herbicides, use of asbestos containing building materials and the presence of imported fill material. The primary off-site potential sources of contamination are from three local service stations in the area.

4.8 Contaminants of Potential Concern

Based on the former use of the site and surrounding areas, the contaminants of potential concern are heavy metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc and mercury), TRHs, BTEX, PAHs, pesticides and asbestos.

4.9 Potential Mechanisms of Contamination

The most likely mechanism for contamination from imported fill and pesticides/termiticides is dry weight and leachable contaminants.

The most likely mechanism from off-site contamination to impact the site is from migration of contaminated groundwater to the site.

4.10 Potentially Affected Media

The potentially affected media are primarily soil and groundwater. If volatile contaminants are observed in soil or groundwater, then further consideration of soil vapour and air (ambient and indoor air once development has been completed) will be necessary.

4.11 Human and Ecological Receptors

The Auditor considers that the human receptors of most concern are future site residents, workers and visitors (following redevelopment), construction workers associated with the development, and intrusive maintenance workers on the site. Risk to off-site human receptors, such as maintenance workers in the road, will need consideration if the site is a source of contamination that could migrate off site.

The Auditor considers that the ecological receptor of most concern is the nearest surface water receptor which receives groundwater discharge. This is likely to be Outer Estuary of Darwin Harbour (160 m to the west). There are unlikely to be any significant ecological receptors on the site itself following redevelopment, as the proposed building footprint and associated car parks will cover the entirety of the site.

4.12 Potential and Complete Exposure Pathways

Table 5: presents a summary of the Auditor's assessment regarding the potential and complete exposure pathways which are of most concern. These are generally consistent with Agon's determinations for on-site receptors.

Table 5: Initial Source – Pathway – Receptor Assessment

Source	Pathway/s	Receptor/s	Complete Linkage
On-site soil	Dermal contact and incidental ingestion	Users of proposed development (maintenance workers); and Users of proposed development (residents, workers, visitors)	Limited Likely
	Inhalation of dust and potential asbestos fibres	Users of proposed development (maintenance workers); and Users of proposed development (residents, workers, visitors)	Limited Likely
	Inhalation of vapours	Users of proposed development (residents, maintenance workers)	Possible
Groundwater underlying the site	Discharge into surface water	Nearby surface water bodies	Possible, although unlikely given distance
	Inhalation of vapours	Users of proposed development (residents, visitors, maintenance workers); and Off-site intrusive maintenance workers, residents or workers	Possible Possible
	Dermal contact and ingestion by humans	Persons extracting groundwater for use in domestic supply (drinking and cooking water, washing etc.), irrigation or for filling swimming pools	Not proposed on site, unlikely down-gradient due to presence of high quality reticulated water supply
	Extraction for stock watering	Ingestion by stock in down-gradient locations (off site)	Unlikely due to urban location
	Extraction for irrigation	Plants (gardens and crops)	Unlikely due to presence of high quality reticulated water supply

Source	Pathway/s	Receptor/s	Complete Linkage
	Underground structures intersecting groundwater	Concrete or steel piles or deep basements following redevelopment	Unlikely given slab-on-ground is proposed although deep underground services (i.e. sewer) may interact with the top of the aquifer

4.13 Post Remediation Conceptual Site Model

The CSM was updated on the basis of environmental investigations and remediation activities documented by SLR. A final CSM was provided in SLR's Validation Report (2022b).

Table 6: Final Source – Pathway – Receptor Assessment

Source	Pathway/s	Receptor/s	Complete Linkage
On-site soil	Dermal contact and incidental ingestion	Users of proposed development (maintenance workers); and Users of proposed development (residents, workers, visitors)	Remediation and validation of site soils. No soil contamination remains on site. However, small quantities of ACM may remain within the soil and be uncovered during excavation works. These ACM fragments are not anticipated to represent a health risk to workers or occupiers of the completed development.
	Inhalation of dust and potential asbestos fibres	Users of proposed development (maintenance workers); and Users of proposed development (residents, workers, visitors)	
	Inhalation of vapours	Users of proposed development (residents, workers, maintenance workers)	No volatile contaminants were identified at the site.
Groundwater underlying the site	Discharge into surface water	Nearby surface water bodies	No site-derived impacts were identified in the groundwater. Elevated concentrations of metals identified in the water were attributed to background conditions associated with naturally occurring aquifer conditions. Refer to Section 9.
	Inhalation of vapours	Users of proposed development (residents, workers, visitors, maintenance workers); and Off-site intrusive maintenance workers, residents or workers	
	Dermal contact and ingestion by humans	Persons extracting groundwater for use in domestic supply (drinking and cooking water, washing etc.), irrigation or for filling swimming pools	
	Extraction for stock watering	Ingestion by stock in down-gradient locations (off site)	
	Extraction for irrigation	Plants (gardens and crops)	
	Underground structures intersecting groundwater	Concrete or steel piles or deep basements following redevelopment	

5 Assessment of Beneficial Uses

The Environment Protection Act 1970 (Vic) defines an environmental audit as:

"… a total assessment of the nature and extent of any harm or detriment caused to, or the risk of any possible harm or detriment which may be caused to, any beneficial use made of any segment of the environment by any industrial process or activity, waste, substance (including any chemical substance) or noise".

All potential beneficial uses of land, groundwater and surface water have been considered for the site, in accordance with the relevant SEPPs as follows:

- Land SEPP;
- Waters SEPP; and
- Air Management/Air Quality SEPP.

5.1 Beneficial Uses of Land

The Land SEPP states that the beneficial uses of land protected by the policy are:

'(a) maintenance of natural ecosystems, modified ecosystems and highly modified ecosystems;

(b) human health;

(c) buildings and structures;

(d) aesthetics; and

(e) production of food, flora and fibre.'

Table 1 from the Land SEPP, which is reproduced below as Table 7: , defines the beneficial uses which require protection for the different land use categories.

Appendix 4 of EPA Publication 759 provides further explanation of the definitions of sensitive use, wherein high-density residential is classified as a density greater than one dwelling per 200 m^2, typically multistorey apartments with limited common garden or open space areas. Sensitive use 'other' comprises medium density residential comprising one dwelling per 200-300 m^2 typically townhouse and unit developments with private courtyard or similar open space, low density residential comprising one dwelling per 300-4,000 m^2 typically detached dwelling with private yard, and rural residential comprising one dwelling per 4,000m – 20,000 m^2.

Based on the proposed high density residential development (Lots B1, B2 and B3 only), the land use is as follows:

- Sensitive Use – with regard to both direct contact and vapour intrusion pathway.

It is noted that EPA Publication 759 notes that *'… all beneficial uses of land are relevant for the purpose of determining whether to issue a Certificate, irrespective of whether they are protected for the current or proposed land use.'* As such, all beneficial uses defined in SEPP (Land) still require consideration in the audit.

Table 7: Beneficial Uses of Land to be Protected

Beneficial use	Land use						
	Parks and Reserves	Agriculture	*Sensitive use*		Recreation /Open Space	Commercial	Industrial
			High density	Other

Note: N/A = not applicable.

5.2 Adopted Soil Assessment Criteria

The following table provides the indicators and objectives which are to be used to determine whether the level of any contaminant poses an unacceptable risk to protected beneficial uses of land.

Table 8: Indicators and Objectives for Beneficial Uses of Land

Beneficial Land Use	Indicators	Objectives
Maintenance of Ecosystems	Chemical substances or waste identified through application of the ASC NEPM (Schedule B2, Appendix A) or any other chemical substance of waste.	Contamination must not adversely affect the maintenance of relevant ecosystems and the level of any indicator must not be greater than – (a) any regional Ecological Investigation Level developed in accordance with the ASC NEPM and published by the Authority for a region in which the site is located. Until such time that regional Ecological Investigation Levels applicable to the site are published, the Interim Urban Ecological Investigation Levels nominated in the ASC NEPM shall be used in its place; or (b) levels derived using the risk assessment methodology described in the ASC NEPM; or (c) levels approved by the Authority.
Protection of Human Health	Chemical substances or waste identified through application of the ASC NEPM (Schedule B2, Appendix A) or any other chemical substance or waste.	Contamination must not cause an adverse effect on human health and the level of any indicator must not be greater than – (a) the screening level specified for human health in the ASC NEPM; or (b) levels derived using a risk assessment methodology described in the ASC NEPM; or (c) levels approved by the Authority.
Buildings and Structures	pH, sulfate, redox potential, salinity or any chemical substance or waste that may have a detrimental impact on the structural integrity of buildings or other structures.	Contamination must not cause the land to be corrosive to, or adversely affect the integrity of, structures or building materials.

Beneficial Land Use	Indicators	Objectives
Aesthetics	Any chemical substance or waste that may be offensive to the senses.	Contamination is not to cause the land to be offensive to the senses of human beings.

5.2.1 Maintenance of Ecosystems

The ASC NEPM provides two types of soil criteria which are based upon protection of the environment, namely Ecological Investigation Levels (EILs) and Ecological Screening Levels (ESLs). Both the EILs and ESLs are to be applied to assess risks to terrestrial ecosystems and apply to the upper 2 m of the soil profile. The EILs and ESLs differ with respect to the contaminants considered and the methodologies used when applying the screening levels.

The EILs cover zinc, arsenic, naphthalene, DDT, chromium (III), copper, lead and nickel. The EILs allow for the consideration of a range of factors which are critical when assessing ecological risks, including:

- The period of time which the contaminant has been in the environment:
    - Fresh is <2 years; and
    - Aged is >2 years.
- Three soil characteristics:
    - Cation exchange capacity (CEC);
    - pH; and
    - Organic carbon content.
- Ambient background concentration (ABC);
- The iron content of the soil (fresh ABC only);
- The state and traffic volume (aged ABC only); and
- Three land use settings:
    - Area of ecological significance;
    - Urban residential/public open space;
    - Commercial and industrial.

An EIL calculator has been provided as part of the '*ASC NEPM Toolbox*' which allows for the derivation of EILs.

Depending on site conditions, such as different soil layers having significantly different properties, more than one set of EILs may need to be derived.

The ESLs are based upon two documents prepared by Dr Michael Warne[1,2], which in broad terms provide a review of guidance provided by the Canadian Council of the Ministers of the Environment (CCME). The ESLs cover the following chemicals:

- Four petroleum hydrocarbon groups:

[1] Warne, M (2010) Review of the appropriateness of the Canadian petroleum hydrocarbon country-wide standards in soil, for incorporation into the Australian National Environment Protection (Assessment of Site Contamination) Measure, National Environment Protection Council, Australia.

[2] Warne, M (2010) Review of the appropriateness of selected Canadian Soil Quality Guidelines (benzene, benzo(a)pyrene, ethylbenzene, toluene and xylenes), for incorporation into the Australian National Environment Protection (Assessment of Site Contamination) Measure, and recommended ecological investigation levels, National Environment Protection Council, Australia.

- F1: C_6-C_{10} minus BTEX;
- F2: >C_{10}-C_{16} minus naphthalene;
- F3: >C_{16}-C_{34}; and
- F4: >C_{34}-C_{40}.

- BTEX; and
- The PAH benzo(a)pyrene (BaP).

It is noted that the ASC NEPM refers to the above-mentioned criteria as ESLs, whereas the Warne (2010) documents refer to the criteria as low reliability EILs.

5.2.2 Protection of Human Health

The ASC NEPM provides Health Investigation Levels (HILs) for four different generic land use settings:

- *'HIL A – Residential with garden/accessible soil (home grown produce <10% fruit and vegetable intake (no poultry), also includes childcare centres, preschools and primary schools.*
- *HIL B – Residential with minimal opportunities for soil access; includes dwellings with fully and permanently paved yard space such as high-rise buildings and apartments.*
- *HIL C – Public open space such as parks, playgrounds, playing fields (e.g. ovals), secondary schools and footpaths. This does not include undeveloped public open space where the potential for exposure is lower and where a site-specific assessment may be more appropriate.*
- *HIL D – Commercial/industrial, includes premises such as shops, offices, factories and industrial sites.'*

The ASC NEPM states the HILs generally apply to the top 3 m of soil for residential use and site-specific conditions should determine the depth to which other HILs apply.

Schedule B1 of the ASC NEPM states that when comparing results to Tier 1 screening levels, where it is appropriate for the exposure being evaluated, consideration should be given to:

- The maximum concentrations detected in relation to the screening levels;
- The 95% upper confidence limit (UCL) of the arithmetic mean concentrations in relation to the screening levels;
- The implications of localised hotspots;
- The standard deviation of the data (i.e. should be <50% of screening level); and
- The magnitude of any screening level exceedances (i.e. should be <250% of screening level).

The ASC NEPM makes reference to direct contact (i.e. dermal contact, incidental ingestion, dust inhalation exposure) HSLs provided for petroleum hydrocarbons in Friebel & Nadebaum (2011). It is understood that these criteria were not presented in the ASC NEPM as the vapour intrusion pathway drives risks for petroleum hydrocarbon exposure. Friebel & Nadebaum (2011) provides direct contact criteria which consider:

- The petroleum hydrocarbon compounds BTEX and naphthalene, as well as the petroleum hydrocarbon groups C_6-C_{10}, >C_{10}-C_{16}, >C_{16}-C_{34} and >C_{34}-C_{40}; and
- Four land use settings which are directly comparable to the ASC NEPM (i.e. HSL A, HSL B, HSL C and HSL D) as well as an additional land use setting (i.e. intrusive maintenance worker).

The ASC NEPM highlights that the direct contact HSLs are likely to represent unacceptable aesthetic characteristics and may also represent unacceptable short-term vapour inhalation risks.

The ASC NEPM also provides management limits which are to be applied after the HILs/HSLs/EILs/ESLs have been considered.

5.2.3 Asbestos

The ASC NEPM provides Health Screening Levels (HSLs) for asbestos in soil, including bonded asbestos containing material (ACM), friable asbestos (inclusive of asbestos fines and fibrous asbestos) and 'all forms of asbestos'. The criteria provided covers exposure scenarios which are comparable to the HILs (i.e. HSL A, HSL B, HSL C and HSL D). The criteria are both quantitative (i.e. % w/w) and qualitative (i.e. no visible asbestos). The ASC NEPM also refers to the WA Department of Health (DoH) Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia provides further details on the assessment and remediation of asbestos. In addition to the screening levels provided in the ASC NEPM for different land uses, the accessible ground surface (as designated by suite investigations or the 10 cm default) should be free from visible bonded ACM and fibrous asbestos at the end of the remedial site works.

The WA Asbestos Guidelines provide details for determining soil asbestos concentrations and interpreting results (Appendix Two) based on the weight of asbestos for a given weight of soil. The methodology looks at estimating asbestos concentrations for a given strata/material.

5.2.4 Soil Vapour

The ASC NEPM provides HSLs for vapour intrusion (i.e. migration of contaminants in subsurface indoor air in the vapour phase) based directly upon Friebel & Nadebaum (2011). HSLs are provided for:

- The following chemicals in soil, groundwater and soil vapour
    - Two petroleum hydrocarbon groups
        - F1: TRH C_6-C_{10} minus BTEX; and
        - F2: TRH >C_{10}-C_{16} minus naphthalene.
    - BTEX; and
    - Naphthalene.
- Four land use settings which are generally comparable to the ASC NEPM (i.e. HSL A, HSL B, HSL C and HSL D). It is noted that buildings with a basement or ground floor car park covering the entire footprint (and no residences within the lowest floor level) are assessed as HSL D for the vapour intrusion pathway.
- Three soil types
    - Sand;
    - Silt; and
    - Clay.
- Four different source to receptor distances
    - 0 m to <1 m;
    - 1 m to <2 m;
    - 2 m to <4 m; and
    - >4 m.

For some soil types and depths, the HSL is higher than the theoretical vapour phase saturation limit. In these instances, no HSL is provided and it is assumed to be not limiting (NL).

Before the HSLs for vapour intrusion can be used, they must be shown to be applicable using the applicability checklist provided in Friebel & Nadebaum (2011).

The vapour intrusion based HSLs do not take aerobic biodegradation of vapours into account, with this degradation process known to be significant under certain conditions. The vapour intrusion based HSLs may be modified by factors of 10 (2 m - <4 m source depths) or 100 (source depths 4 m and greater) if the following conditions are met:

- The scenario is based on a slab-on-ground or ventilated crawl space building;
- There is direct measurement of oxygen at a depth of 1 m or greater;
- The vapour source is no closer than 2 m from a current or proposed building foundation;
- The current or proposed building foundation has a width no greater than 15 m (oxygen penetration limited at greater widths); and
- The source concentration is less than 100 mg/m^3.

The ASC NEPM includes interim vapour intrusion HSLs for trichloroethene (TCE), 1,1,1 trichloroethane (1,1,1 TCA), tetrachloroethene (PCE), cis 1,2 dichloroethene (cis 1,2 DCE) and vinyl chloride (VC). In the absence of more applicable criteria these HSLs are considered to be applicable.

Where criteria are not provided in Friebel & Nadebaum (2011) or the ASC NEPM, reference is made to other reputable guidance sources on a case by case basis.

5.2.5 Buildings and Structures

Australian Standard AS2159 (2009) *Piling – Design and Installation* provides exposure classification values for concrete and steel piles in soil (non-aggressive to severely aggressive) based upon chlorides, sulfates and pH. In the absence of a directly applicable EPA endorsed criteria, these guidelines are considered to be appropriate in assessing the potential for detrimental impacts of site soils to buildings and structures. In addition, the presence of other aggressive chemical compounds (e.g. acids) may be potentially detrimental to buildings or structures.

The ASC NEPM states that the management limits are relevant for '*operating sites where significant sub-surface leakage of petroleum compounds has occurred and when decommissioning industrial and commercial sites'*. The ASC NEPM states that the intent of the management limits is to minimise the potential for petroleum hydrocarbons to cause the formation of light non-aqueous phase liquid (LNAPL), fire/explosive hazards and effects on buried infrastructure.

5.2.6 Aesthetics

The SEPP (Land) states that *Contamination must not cause the land to be offensive to the senses of human beings*.

The aesthetic condition of soil is assessed with respect to the guidance provided in Schedule B1 of the ASC NEPM (Section 3.6). In general terms, consideration is given to the presence of non-hazardous foreign materials, discoloration and odorous soils.

5.2.7 Production of Food, Flora and Fibre

SEPP (Land) states that *'Contamination of land must not ... (b) affect the level of any indicator in food, flora and fibre produced at the site (or that may be produced) such that the level of that indicator is greater than that specified by the Australia New Zealand Food Authority, Food Standards Code.'*

The Food Standards Code provides maximum levels (MLs) for various organic and inorganic chemicals in various foods, with the MLs for each chemical varying dependent on the food type. The Food Standards Code does not provide threshold criteria for contaminant levels in soils. The correlation between contaminant levels in soils and resulting contaminant levels in food, flora and fibre produced in soils is complex and related to the bioavailability of the contaminant, the rate at which the contaminant is taken up by the crop/stock and the ability of various crop/stock to regulate the contaminant.

As a conservative measure and in the absence of directly applicable criteria, it is assumed that the site has been polluted at potentially unacceptable levels with respect to the production of food, flora and fibre if the contaminants of concern are present at levels above that which can reasonably be considered to represent background levels. It is noted that a site may not be suitable to produce food, flora and fibre due to natural background levels of a range of contaminants (i.e. arsenic).

5.3 Beneficial Uses of Groundwater

SEPP (Waters) divides groundwater into seven segments based on total dissolved solids (TDS) concentration ranges. The following table, which is based on Table 1 of SEPP (Waters), defines the beneficial uses of groundwater which require protection for each segment. Based upon the available TDS data for the on-site bores (range 120 to 430 mg/L), the water table aquifer at the site is classified as Segment A1.

The Auditor considered Segment A1 to be appropriate to the audit site.

Table 9: Beneficial Uses of Groundwater to be Protected

Beneficial use	Segments (mg/L TDS)						
	A1 (0–600)	A2 (601–1200)	B (1201–3100)	C (3101–5400)	D (5401–7100)	E (7101–10,000)	F (>10,001)
Water dependent ecosystems and species	✓	✓	✓	✓	✓	✓	✓
Potable Water Supply (desirable)	✓	N/A	N/A	N/A	N/A	N/A	N/A
Potable Water Supply (acceptable)	**N/A**	✓	N/A	N/A	N/A	N/A	N/A
Potable Mineral Water supply #	✓	✓	✓	✓	N/A	N/A	N/A
Agriculture and irrigation (irrigation)	✓	✓	✓	N/A	N/A	N/A	N/A
Agriculture and irrigation (Stock Watering)	✓	✓	✓	✓	✓	✓	N/A
Industrial and commercial	✓	✓	✓	✓	✓	N/A	N/A
Water-based recreation (Primary Contact Recreation)	✓	✓	✓	✓	✓	✓	✓
Traditional Owner cultural values	✓	✓	✓	✓	✓	✓	✓
Cultural and spiritual values	✓	✓	✓	✓	✓	✓	✓
Building and Structures^	✓	✓	✓	✓	✓	✓	✓
Geothermal properties *	✓	✓	✓	✓	✓	✓	✓

The site is not within a declared mineral water resource area and this beneficial use is not considered relevant.

^ The proposed development of the site is understood to have no proposed basements, but has been included in the case of deep underground services.
* Groundwater at the site was not found to have geothermal properties (described in the Waters SEPP as a natural thermal capacity which corresponds to a temperature between 30 and 70 degrees Celsius), and therefore this beneficial use was not considered relevant at this site.

5.4 Adopted Groundwater Assessment Criteria

5.4.1 Water Dependent Ecosystems and Species (WDES), Traditional Owner Cultural Values (TOCV) and Cultural and Spiritual Values (CSV)

In accordance with the Waters SEPP, groundwater must not cause receiving waters to be affected to the extent that the level of any environmental quality indicator is greater than the level of that indicator specified for surface waters in the SEPP. This means that the likely receiving water body should be identified and that the WDES criteria for the receiving water body be applied at the point of groundwater discharge.

For screening purposes, the relevant WDES criteria are initially applied to assess the condition of groundwater underlying the site. If there are analyte concentrations in groundwater which exceed the adopted WDES criteria, then further consideration should be given as to whether elevated concentrations are likely to reach the point of discharge, and impact on the receiving water body.

The likely receiving water body for groundwater underlying the site is Outer Estuary of Darwin Harbour. The water body is considered to be a slightly-moderately modified aquatic ecosystem, with environmental quality objectives for protection generally corresponding to 95% species protection as defined in ANZG (2018).

Unless specific objectives are described in the SEPP, the environmental quality objectives for the WDES are those values specified in:

1. ANZG (2018), *Guidelines for Fresh and Marine Water Quality*, 2018 – 95% level of protection.

For beneficial uses that do not have specific environmental quality indicators or objectives provided in the Waters SEPP, the objectives for WDES can be adopted. This is based on the assumption that water-based ecosystems and species are typically the most sensitive beneficial use to pollution. Consistent with the Waters SEPP and in the absence of contrary regulatory advice, the Auditor has also adopted the WDES objectives for TOCV and for CSV.

5.4.2 Potable Water Supply

Reference is made to the current version of the *Australian Drinking Water Guidelines* when assessing drinking water use, which is currently National Health and Medical Research Council (NHMRC) version 3.7 (2022).

The NHMRC drinking water criteria are largely based upon the World Health Organisation (WHO) drinking water criteria. However, there are some compounds where NHMRC has drawn a different conclusion to WHO and a number of other compounds where WHO provides some criteria but NHMRC has not adopted any criteria. Consideration to WHO criteria is given on a case by case basis, as deemed appropriate by the Auditor. In the absence of more applicable criteria, WHO (2008)[3] criteria have been adopted to assess TRH.

5.4.3 Agriculture and Irrigation (Irrigation)

To assess risks from use of groundwater for irrigation of agriculture, parks and gardens, reference has been made to the water quality objectives for irrigation waters in Section 4.2 of the ANZECC (2000), as these are retained under ANZG (2018).

[3] WHO (2008) *Petroleum Products in Drinking Water*, Background Document for Development of WHO Guidelines for Drinking-Water Quality.

5.4.4 Agriculture and Irrigation (Stock Watering)

To assess risks to livestock consuming groundwater, reference has been made to Sections 4.3 and 9.3 of ANZECC (2000), as ANZG (2018) has not yet been updated for stock watering. It is assumed that livestock could consume metals which are dissolved, complexed within an organic compound or bound to sediments (i.e. non-filtered total concentrations).

ANZECC (2000) does not provide livestock drinking water guidance for organic contaminants. ANZECC (2000) recommends that human drinking water criteria are adopted for pesticides. In the absence of more applicable data, the Auditor adopts the same approach for other organics.

5.4.5 Industrial and Commercial

The earlier version of the ANZECC (2000) Guideline (i.e. 1992) provided criteria for a range of contaminants and industrial processes, however, ANZECC (2000) states that:

> *'After extensive consultation with representative industrial groups, the current guidelines provide no specific guidance for industrial water use, because industrial water requirements are so varied (both within and between industries) and sources of water for industry have other coincidental environmental values that tend to drive management of the resource. Industrial water use continues to be a recognised environmental value that has high economic benefit to the community. It must be given adequate consideration during the planning and management of water resources.'*

It is understood that the current informal EPA Victoria policy is to also consider the appropriateness of industrial water use based upon a qualitative approach (i.e. related elevated concentrations of a contaminant). For the purpose of the audit, groundwater objectives for other uses are expected to be protective of this beneficial use.

5.4.6 Water-Based Recreation (Primary Contact Recreation)

The Waters SEPP specifies that E. coli count must be less than 10 per 100 mL, or zero per 100 mL if human faecal sources of contamination have been identified (such as septic tanks or sewerage infrastructure).

Environmental quality objectives and indicators for long-term chemical hazards are based on National Health and Medical Research Council (NHMRC 2008) *Guidelines for Managing Risks in Recreational Water*, which in turn references the *Australian Drinking Water Guidelines* (NHMRC, latest version 3.7 dated January 2022).

Where inhalation of vapours and dermal contact are not a concern, the relevant health based drinking water criteria is multiplied by 10 to represent incidental ingestion. Where inhalation of vapours and/or dermal contact are a concern, the relevant health-based drinking water criteria are adopted without modification. In some instances, it is important to consider the foundation of the drinking water criteria value and determine whether it is logical to multiply the criteria by 10 (e.g. nitrate drinking water criteria is based upon protecting bottle fed infants, which is not relevant for primary contact recreation exposure).

5.4.7 Buildings and Structures

For the protection of buildings and structures, SEPP (Waters) specifies that the following indicators should be considered: pH, sulfate chloride, redox potential, salinity and any chemical substance or waste that may have a detrimental impact on the structural integrity of buildings or other structures. Australian Standard AS2159-2009 *Piling – Design and Installation* provides values for pH, sulfate and chloride for building and structures, and reference should also be made to the ASC NEPM (2013).

It is noted that the AS2159 criteria for sulfate in water is provided as sulfate-SO_3. A conversion to sulfate-SO_4 (i.e. 100 ppm S-SO_4 = 80 ppm S-SO_3) results in a sulfate-SO_4 criteria for non-aggressive conditions of 375 mg/L.

5.5 Beneficial Uses of Surface Water

Surface water has been considered as part of this audit in accordance with the SEPP (Waters). Table 10, which is based on Table 3 of SEPP (Waters), defines the beneficial uses of surface waters which require protection based upon geographical location[4].

No surface water bodies exist on site. The nearest surface water body is the mangrove of the Outer Estuary of Darwin Harbour, located 160 m to the west, therefore the Urban segment is applicable for this site. Given the proposed commercial development, and subsequent management of surface water through stormwater drains, the site is not deemed likely to have any potential impact on surrounding surface water bodies.

Table 10: Beneficial Uses to be Protected (Inland Waters)

	Water	Aquatic Reserves	Rivers & Streams						Wetlands
Beneficial Uses	**Segment**	**Aquatic Reserves**	**Highlands**	**Uplands A**	**Uplands B**	**Coastal Foothills and Coastal**	**Urban**	**Murray and Western Plains**	**Lakes & Swamps**
Water dependent ecosystems and species that are:	Largely unmodified	✓	✓	✓	✓	N/A	N/A	N/A	N/A
	Slightly to moderately modified	N/A	N/A	N/A	N/A	✓	N/A	✓	✓
	Highly modified	N/A	N/A	N/A	N/A	N/A	✓	N/A	N/A
Human consumption after appropriate treatment		✓ where water is sourced for supply in accordance with the special water supply catchments area set out in Schedule 5 of the Catchment and Land Protection Act 1994 or the Safe Drinking Water Act 2003.							
Agriculture and Irrigation		N/A	✓	✓	✓	✓	✓	✓	✓
Human consumption of aquatic foods		✓	✓	✓	✓	✓	✓	✓	✓
Aquaculture		✓ where the environmental quality is suitable and an aquaculture licence has issued under the *Fisheries Act 1995*							
Industrial and commercial		N/A	N/A	✓	✓	✓	✓	✓	N/A

Water-based recreation (secondary contact)		✓*	✓	✓	✓	✓	✓	✓	✓
Water-based recreation (aesthetic enjoyment)		✓*	✓	✓	✓	✓	✓	✓	✓
Traditional Owner cultural values		✓	✓	✓	✓	✓	✓	✓	✓
Cultural and spiritual values		✓	✓	✓	✓	✓	✓	✓	✓
Navigation and shipping		N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

Note: If a segment is marked with a tick that is asterisked, there is an exclusion identified in Table 5 (see clause 1(4) of Schedule 2 SEPP (Waters)).

SEPP (Waters) recommends that ANZECC (2000) is used as the source of assessment criteria, unless SEPP (Waters) provides alternative criteria.

[4] Figure 1 of SEPP (Waters) defines the policy area and segments.

5.6 Beneficial Uses of Ambient Air

The 1999 Ambient Air Quality SEPP and the 2001 Air Quality Management SEPP, are the relevant SEPPs that provide the framework for ambient air management in Victoria (air being defined as "*the external air environment, it does not include the air environment inside buildings or structures"*). The SEPP (Ambient Air Quality) was prepared to adopt the requirements of the National Environmental Protection Council (Ambient Air Quality). SEPP (Air Quality Management) was prepared in part to ensure that the objectives of SEPP (Ambient Air Quality) are met.

Section 9 of SEPP (Air Quality Management) states that the following beneficial uses of ambient air are protected throughout Victoria:

'(a) life, health and well-being of humans;

(b) life, health and well-being of other forms of life, including the protection of ecosystems and biodiversity;

(c) local amenity and aesthetic enjoyment;

(d) visibility;

(e) the useful life and aesthetic appearance of buildings, structures, property and materials; and

(f) climate systems that are consistent with human development, the life, health and well-being of humans, and the protection of ecosystems and biodiversity.'

The Auditor has assessed whether or not ambient air is likely to be polluted on the basis of:

- Land pollution (including soil, soil gas and soil vapour);
- Groundwater pollution; and
- Surface water pollution.

Where ambient air pollution is considered to be likely, ambient air sampling/analysis is conducted and quantitative criteria are considered.

SEPP (Air Quality Management) does not provide indicators and objectives for the majority of contaminants which can be of concern at a typical contaminated site.

Section 10 of SEPP (Air Quality Management) defines four classes of ambient air quality indicators, namely:

a) 'Class 1 indicators: common or widely distributed air pollutants which are established as environmental indicators in the State Environment Protection Policy (Ambient Air Quality) and may threaten the beneficial uses of both local and regional air environments;

b) Class 2 indicators: hazardous substances that may threaten the beneficial uses of the air environment by virtue of their toxicity, bio-accumulation or odorous characteristics;

c) Class 3 indicators: extremely hazardous substances that are carcinogenic, mutagenic, teratogenic, highly toxic or highly persistent, and which may threaten the beneficial uses of the air environment; and

d) Unclassified indicators: indicators of the beneficial uses of local amenity and aesthetic enjoyment, namely odour and total suspended particles (nuisance dust).'

SEPP (Ambient Air Quality) provides environmental quality objectives and goals for carbon monoxide, nitrogen dioxide, photochemical oxidants, sulfur dioxide, lead, particles as PM10 and visibility reducing particles.

SEPP (Air Quality Management) provides:

- design criteria for new or expanded emission sources (Schedule A);
- intervention levels for the substances noted in Schedule A (Schedule B);
- emission limits for existing stationary sources (Schedule D); and
- emission limits for new stationary sources (Schedule E).

For scenarios where the above-mentioned indicators/objectives are not relevant, impacts to air quality are assessed on a case by case basis.

6 Summary of Investigation Process and Findings

The following section provides a summary of the detailed site investigations undertaken at the site, split into the separate segments of the environment.

6.1 Soil Investigations

A summary of the soil investigations and soil sampling undertaken for the entire site (including Lot B1, B2 and B3) is provided in the following table.

Table 11: Summary of Soil Investigations at the Site

Date (Consultant)	Sample Locations	Lot B Locations	Sampling Methodology and Depth (Site Wide)
June and August 2019 (Greencap)	Boreholes SS01-1 to SS01-4, SS02-1 to SS02-4, SS01 to SS44 Test pits: TP01 to TP29	TP01 – TP05, SS17 – SS44	Surface soil locations (n=52). Soil samples collected from the surface around the perimeter of buildings Analysis for contaminants of concern (CoC) heavy metals, organochlorine pesticides (OCP) Grid test pits (n=29) sampling up to 0.9 mbgl. Soil samples recovered directly from the centre of the excavator bucket. Analysis for asbestos.
September 2019 (Greencap)	Boreholes SS45 to SS64, SS65_N, SS65-E, SS65-S, SS65-W, SS66-N, SS66-E, SS66-S, SS67-N, SS67-E, SS67-S, SS68-N, SS68-E, SS68-S, SS68-W, SS69-N, SS69-E, SS69-S, SS69-W Test pits: TP01 to TP57	SS55 – SS63, SS68, SS69, TP10, TP11, TP13, TP14, TP16 – TP19, TP21, TP22, TP24, TP25, TP27, TP28, TP36 – TP49, TP51, TP55 - TP57	Surface soil locations (n=64). Soil samples collected from the building footprints and delineation of previously identified OCP impacts Analysis for OCP Test pits (n=57) delineation of previously identified ACM impacts. Analysis for asbestos.
November 2019 (Agon)	Test pits: TP01 to TP20	TP9, TP11, TP13, TP14, TP16 – TP20	In-fill grid sampling (n=20) to between 0.7-1.2 mbgl, collected from the centre of excavator bucket. Analysis for CoC and selected samples for a broader analytical suite.
December 2019 (Agon)	Boreholes MW01 to MW04	MW02 and MW03	Soil samples recovered during drilling for groundwater wells (n=10), sample collection methodology was not documented by Agon. Analysis for TRH, BTEXN, lead, select samples for PAH

September 2021 (SLR)	North South Easement Validation samples: B01_0.7, B02_0.7, B03_0.8, B04_1.4, B05_1.0, B06_1.2 B07_1.2, B08_07, E01_0.1, E02_0.1, E03_0.1, E04_0.1, E05_0.1, E06_0.1, E07_0.1, E08_0.1, W01_0.1, W02_0.1, W03_0.1, W04_0.1, W05_0.1, W06_0.1, W07_0.1	All locations specific to Lot B2 & B3 sewer easement	Validation samples were collected from the base and walls of the excavation. Analysis for asbestos in soils – presence/absence and/or FA/AF.
September 2021 (SLR)	East West Easement Validation samples: B01_0.8, B02_0.8, B03_1.1, B04_0.8, B05_0.7, E021_0.4, E02_0.6, E03_0.3, N01_0.1, N02_0.2, N03_0.2, N04_0.1, N05_0.2, S01_0.2, S02_0.2, S03_0.1, S04_0.2, S05_0.2	All locations specific to Lot B2 sewer easement	Validation samples were collected from the base and walls of the excavation. Analysis for asbestos in soils – presence / absence and / or FA/AF.
September 2021 (SLR and Greencap)	Stockpile (imported soil) samples: STP-A.1 to A.3, STP-B.1 to B.3, STP-C.1 to C.7	Specific to backfill of the sewer trench in Lots B and C.	Analysis for TRH, BTEXN, pesticides, herbicides, PCBs, PAHs, metals and AF/FA.

The soil and groundwater investigation sampling locations are shown on Attachments 4 and 5 respectively.

The results of the soil investigations are summarised below.

Fill materials were encountered across the site consisting of sandy silt and sandy gravelly silt varying in depth from 0.4 mbgl to a maximum depth of 1.8 mbgl. The assessor reported no visual or olfactory indication of contamination in the general fill material, other than fragments of ACM.

Natural soils consisted of red brown silty clay soil. Natural soil conditions comprise weathered rock or rock across the site.

ACM was observed in fill at the site and on the site surface during sampling and site inspections by Greencap, Agon and SLR.

The fill materials across the site also contained concentrations of aldrin+dieldrin exceeding HIL A and HIL D criteria (up to 369 mg/kg, SS30 within Lot B3). The highest aldrin+dieldrin concentration reported was considered to be an anomaly as this concentration could not be replicated in any additional sampling undertaken and was collected prior to commencement of the audit. The next highest concentration was 23.4 mg/kg (surface sample SS69_S(5)_0.0) exceeding HIL A, but below HIL D criteria. This location (and other OCP hotspots) were removed and validated as part of remediation works detailed in Section 7.

All other analytes were below laboratory detection limits or assessment criteria.

The natural soils across the site contained elevated concentrations of nickel with respect to the ecosystem criteria adopted by Agon for these analytes, these analytes were considered to be naturally occurring. All other natural soil concentrations were below either laboratory detection limits or adopted assessment criteria.

No volatile contaminants were detected in soil at levels above the vapour intrusion screening levels.

6.1.1 Area-Specific Data (Lots B1, B2 & B3)

In total 67 samples were analysed for pesticides; some of these samples exceeded residential criteria for heptachlor and aldrin+dieldrin but all results were below the relevant criteria for commercial use. The areas of the site where samples reported impact above the nominated residential criteria, have since been excavated and validated as part of subsequent remediation works, detailed in Section 7.

Numerous samples were also analysed for ACM (bonded and AF/FA). During soil investigations ACM (and/or AF/FA which was co-located with bonded ACM at some locations) was reported by the laboratory above criteria at nine locations on site. Fill was excavated to apparent natural soils, and visually and chemically validated for ACM and AF/FA.

Soil and crushed concrete from other areas on site were placed temporarily in a stockpile on site (STP5), which was validated after removal.

6.2 Groundwater Investigations

A summary of the groundwater investigations undertaken for the greater site (encompassing Lots A, B and C) is provided in the following table.

Table 12: Summary of Groundwater Investigations at the Site

Date (Field Work)	Sample Locations	Sampling Methodology and Depth
GME1 December 2019 and January 2020 (Agon)	MW01 to MW04 (install and sample)	Installation and gauging of MW01 to MW04. Low flow purging and sampling. Analysis of samples for TRHs, BTEX, PAHs, chlorinated hydrocarbons, pesticides, herbicides, 14 metals, phenolics, halogenated benzenes, halogenated hydrocarbons, solvents, chloride and sulfate.

The groundwater well locations are shown in Attachment 5.

The findings of the groundwater investigations are summarised as follows:

- Although the groundwater monitoring wells were not surveyed, it is expected that the groundwater flow direction underlying the site would be to the west, consistent with expected regional flow toward the Darwin Harbour. Standing water levels ranged from 2.7 to 3.8 mbtoc;
- Field readings recorded redox potential in the range 123 to 318 mV, electric conductivity ranged between 166 and 880 µS/cm and dissolved oxygen levels ranging from 2.68 to 5.77 mg/L). Groundwater was acidic (4.4 to 5.6 pH units);
- No measurable separate phase hydrocarbons (NAPL) or sheen was reported in groundwater from on-site or off-site wells, and no odours were reported;
- Low levels of TRHs (maximum of 0.28 mg/L) were detected in on-site wells MW01 and MW02, at concentrations well below the Dutch intervention criteria. Agon conducted silica gel clean-up on the MW01 groundwater sample to determine if the low-level hydrocarbons were petroleum based or naturally occurring. The results of the silica gel clean-up were all below the laboratory limit of reporting indicating they were naturally occurring hydrocarbons or highly degraded fuel;
- Low levels of the chlorinated hydrocarbon chloroform was detected in two on-site wells, at concentrations well below adopted criteria for human health and ecosystem protection;
- Cobalt exceeded WDES criteria in all wells;
- Concentrations of copper and nickel exceeded the WDES criteria in one or more wells but were considered naturally occurring. The maximum nickel concentration also exceeded the recreational and irrigation water criteria;
- Lead exceeded the WDES criteria in three wells and the drinking water criteria in one well;
- Manganese exceeded the recreational water criteria in three wells, with the maximum also exceeding the irrigation criteria; and
- Concentrations of other metals (arsenic, beryllium, boron, cadmium, mercury, and selenium), PAHs, BTEX, halogenated benzenes, halogenated hydrocarbons, solvents, pesticides, herbicides, chloride, sulfate and phenols were not detected above the adopted assessment criteria for any beneficial uses.

6.3 Potential for Vapour Intrusion

The groundwater and soil results did not identify that a vapour intrusion risk required assessment. Refer to details regarding low level concentrations of TRH (in groundwater) and chloroform (in groundwater), detailed in Sections 8 and 9.

6.4 Auditor's Opinion on Investigations – Lot B

When preparing this section of the EAR, the Auditor has given particular attention to Appendix 3 of EPA Publication 759 which states that an EAR should provide *'… an opinion on the quality and completeness of prior assessment(s) of the site, including details of investigator, laboratory, sampling and analytical methods and type of assessment undertaken …'*

The Auditor considers as a whole, the data collected is within acceptable error margins as determined through the assessor's Data Quality Objectives (DQO) (refer to Section 4.5 of SLR's (2021) Validation Report). As such, the Auditor considers that the data collected is sufficient to adequately characterise the site for the audit purposes, given:

- The lack of significant systematic errors with the data collection process;

- Absence of major gaps in understanding of the site use over time;
- All identified point sources of contamination were investigated with the soil investigation undertaken including 482 grid and targeted (including validation) locations, which exceeds the AS4482.1 recommended number of sampling locations for an approximately 0.9 hectare site (20 locations);
- The groundwater investigations undertaken across the site included a total of four on-site groundwater wells which were monitored. The groundwater investigations did not identify site-derived groundwater contamination, which supports the adequacy of the soil investigations across the site;
- The large number of samples collected across the site and the comprehensive suite of analysis undertaken, which addresses inherent data gaps in site histories;
- The laboratory analysis was undertaken by NATA accredited laboratories;
- The site-specific geology and hydrogeology is consistent with anticipated regional conditions;
- The analytical results are consistent with expectations based on the site history and field observations; and
- The excavation of the site to natural soils.

The Auditor considers the quantity and quality of the site investigations undertaken are adequate to characterise the nature and extent of contamination at the site. The Auditor considers the data collected is sufficient for the purposes of this environmental audit. The Auditor is of the view that the site has been assessed and characterised adequately within the means and information available to the Auditor at the time of preparing this EAR.

7 Remediation

The following section provides a summary of the remediation works undertaken at the site.

7.1 Remediation and Validation of OCP Impacts – Agon 2019

Remediation works in the form of hotspot removal, was undertaken by Agon between 9 October and 5 November 2019, prior to commencement of this audit.

Soil investigations completed by Greencap had identified the presence of OCPs (heptachlor and aldrin+dieldrin) above HIL A in multiple locations across the site. Agon undertook hotspot removal works at some of these locations in 2019; this involved the excavation of soils, extending 5 m laterally from each hotspot to a depth of 0.5 m. The soils from these locations was transported to Lot A as the soil met HIL D commercial land use – police station.

The exact locations are unclear, however as all the exceedances were located in surface samples, any locations which were not remediated by Agon would have been removed as part of the later bulk fill excavation works which extended to natural (details provided in Section 7.3).

As part of the validation works, numerous soil validation samples were collected from the base of the excavation. All results reported concentrations of OCPs below HIL A criteria.

7.2 Remediation and Validation of Asbestos Impacts – Agon 2019

Remediation works in the form of hotspot removal, was undertaken by Agon between 9 October and 5 November 2019, prior to commencement of this audit.

Soil investigations were previously undertaken by Greencap, and in 2019 Agon identified the presence of asbestos at multiple locations across the site. Agon undertook hotspot removal works at two locations, which reported the presence of friable asbestos (TP38 and TP39). The fill at these locations was excavated to natural at a radius of 2.5 m from the location. The soil was disposed of as asbestos contaminated waste. Validation of these locations (via observation or laboratory data) was not documented. However, as the fill at these locations was later removed as part of the bulk excavation works (detailed in Section 7.3) which extended to natural, the absence of this information is not significant.

7.3 Remediation and Validation of Asbestos Impacts – SLR 2020

Further environmental investigations required by the Auditor identified that the asbestos contamination in soil was more widespread than the isolated hotspots identified in the initial site investigations. Additional remediation and validation works were undertaken by SLR between 20 July and 28 September 2020.

Bulk excavation of fill was undertaken by the Contractor, the maximum depth of excavation extended to 2 mbgl. Surface soils were excavated to apparent natural soil conditions (either weathered rock or rock). All known and encountered abandoned underground services (including fill material surrounding them) were removed during bulk excavation. Based on visual observations potentially impacted soil was stockpiled separately top non-impacted spoil.

Validation samples were collected from the floor and walls of the excavation, and along remediated surface trenches. Out of 286 validation samples tested from the base and walls of the excavation and trenches, the presence of asbestos was detected in seven samples. Further excavation was undertaken at these location, extending a further 0.3 m into the natural reworked soils and extending laterally within an approximate area of 25 to 90 m^2 around each location. Additional validation samples were collected from the resulting excavation; the results did not detect further asbestos. The validation samples are shown in Attachment 8.

Spoil from the excavated area was inspected for asbestos contamination and segregated where required. Spoil was either loaded directly into trucks or temporality stockpiled in designated areas within Lot B3 and

the road reserve. The stockpiles were screened to remove geotechnically unsuitable waste materials and ACM. Validation samples were collected from the stockpile footprint once removed from site, these the results did not detect asbestos. The ACM fragments and soils impacted with ACM were placed in STP5 located on a sealed surface within the road reserve, for offsite disposal as asbestos waste. STP5 was disposed of off site as "special waste – asbestos" to Shoal Bay Waste Management Facility (SBWMF).

No visual indications of contamination (staining or odours) were observed during remediation works, apart from bonded ACM. ACM fragments were found during the stripping of the fill, as well as at the former buildings' footings, stormwater risers and former service pipes. Several abandoned services including stormwater, sewer pipes, water distribution pipes, and electrical and communication cables were removed during earthworks.

The excavated areas were re-instated with screened spoil which had been characterised as suitable for site re-use. The surface of each 200 mm lift of reinstated material was visually inspected by SLR for the presence of ACM. No visual evidence of asbestos was identified on the surface of any lifts.

Asbestos clearance certificates were provided within the validation report (Appendix C).

Remediation works extended to within 3 m of the eastern boundary of Lots B2 and B3 due to the presence of a "live" sewer main which runs along the boundary. Details of these works is provided in Section 7.5.

SLR also conducted airborne asbestos fibre monitoring on each day of remediation works and there were no exceedances of the 0.01 f/mL criteria. It is understood that monitoring was conducted during reinstatement of soils.

7.4 Off-site Soil Disposal and Re-use of Soil Stockpiles within Lot B

SLR characterised the stockpiles of spoil generated during excavation of the site. These stockpiles were tested for TRH, BTEXN, OCP/OPP, asbestos (laboratory and bulk samples) and eight metals.

Asbestos in the form of ACM and AF/FA was detected above investigation levels in stockpiles:

- STP4 (which was consolidated into STP13);
- STP5 (comprising the asbestos impacted soils and ACM waste from Lots B1 and B2 disposed of to SBWMF as "special waste – asbestos");
- STP7 (was retested and considered suitable);
- STP10 (segregated and impacted section removed to STP5);
- STP15 (segregated and impacted section removed to STP5);
- STP16 and STP16A (segregated and impacted section removed to STP5);
- STP16B (disposed of to SBWMF as "special waste – asbestos");
- STP21 and STP21A (segregated and impacted sections removed to STP5);
- STP21B (disposed of to SBWMF as "special waste – asbestos");
- STP23 (comprising the asbestos impacted soils and ACM waste from Lots B2 and B3 disposed of to SBWMF as "special waste – asbestos");
- STP33 (comprising the waste material generated when screening spoil from Lot B3 disposed of to SBWMF as "special waste – asbestos"); and
- STP34, 35, 36 and 37 (comprising ACM waste from Lot B3 disposed of to SBWMF as "special waste – asbestos").

The designated asbestos waste stockpiles (STP5, STP23, STP33, STP34, STP35, STP36 and STP37) and segregated asbestos stockpiles STP16B and STP21B were disposed of to SBWMF as "special waste – asbestos". The disposal dockets are provided in Appendix J of SLRs Validation Report (2022).

Soils (and crushed concrete) which met the re-use criteria were reused on site (within Lots B1, B2 and B3). The sampling density achieved (1 sample per 55 m^3), is below the *WA Guidelines for Assessment, remediation and Management of Asbestos-Contaminated Sites in Western Australia*, however this is not

considered an issue given the stockpiles have been segregated and are not the result of asbestos abatement works. Further, the reuse of soils was placed down in layers for compaction purposes, and each lift was visually inspected by SLR for asbestos. No visible asbestos was encountered by SLR during the visual inspections for Lots B1, B2 or B3. The inspection clearance certificates are provided in Appendix C of SLRs Validation Report (2022b).

7.5 Sewer Easement

The site area includes a sewer easement which is located along the eastern boundary of Lots B2 and B3, and along the southern boundary of Lot B2 (refer to Attachment 7). During the main remediation works, this sewer was "live" and works within 3 m of the sewer were limited to some topsoil stripping (maximum depth of 0.3 mbgl) and targeted removal of soil where asbestos impact was visually determined.

As part of development the sewer was upgraded, at which time the following remediation works were able to be completed within the sewer easement:

- Removal of surface fill. This fill material and any associated ACM debris was placed directly into skip bins and removed off site under asbestos conditions.
- The final extent was visually assessed and validation samples collected from the base and walls of the excavation. Further excavation, reinspection and validation was undertaken at locations where ACM debris was identified.
- Following removal of the surface fill, the deeper reworked natural soil and bedding sands used to backfill the sewer were removed, along with the removal of the sewer and related infrastructure. This spoil was placed to the side of the trench inspected for asbestos, ACM debris and surrounding soil was placed directly into skip bins and removed offsite under asbestos conditions. The remaining spoil once cleared as not being impacted with ACM debris, was used to backfill the trench.
- The resultant excavation was visually inspected for the presence of asbestos debris. No validation samples were collected as the excavation trench extended into natural.
- Imported soil was used to backfill the resultant trench (details in Section 7.5).

The final clearance certificates for the surface clearance and backfill works are provided in Appendix B of the Sewer Easement Validation Report (SLR, 2022). No ACM debris was found during the clearance inspections.

Where asbestos was detected at the boundary of the site (i.e. over excavation was not possible), geofabric was placed over the area to prevent asbestos fibres/ACM debris from falling onto the site, and to act as a warning layer for future excavation. Asbestos was detected in one sample collected from the eastern property boundary (E01-04). Geofabric was placed over the eastern wall of the excavation, to a depth of approximately 1.2 mbgl. The location of the geofabric is shown in Attachment 9.

7.6 Importation of Fill Material

Two sources of soil were assessed for importation to site:

- Virgin excavated natural material (VENM) from the extractive mining pits operating under licences MA24585 and MA24642 (approximately 39 m^3); and
- Screened stockpiled soil that had been excavated from other construction worksites in Darwin (approximately 56 m^3). Based on information the soil was not sourced from sites operated by the Department of Defence, Airports and/or other sites where current and historical use of fire-fighting foam had occurred.

SLR classified the soils prior to importation. A visual inspection of the stockpiles did not find any evidence of visible ACM, odours or stains. A third party (Greencap) collected samples for the purpose of investigation asbestos impacts, no asbestos was detected at or above the limit of reporting. Based on the analytical results, SLR was of the opinion that the contamination status of the stockpiles sampled would not present them being used as backfill for the sewer headworks project and the site.

7.7 Auditor's Opinion on Remediation Data

The remediation works are likely to have resulted in the removal of the known contaminated soils at the site.

The Auditor considers that as a whole, the remediation data collected are within acceptable error margins as determined through the assessor's quality assurance program (refer to Section 4.5 of SLR Validation Report). As such, the Auditor considers that the data collected is sufficient to adequately characterise the site for the audit purposes, given:

- The lack of significant systematic errors with the validation data collection process;
- Soil contamination was visually identified by SLR during excavation works;
- Removal of all fill material down to natural soil, screening and inspection of stockpiled material prior to re-use;
- Collection of validation samples from the final excavation extent and laboratory analysis was undertaken by NATA accredited laboratories;
- The analytical results are consistent with expectations based on the site history and field observations; and
- Removal of ACM off site as "asbestos waste".

The Auditor considers the quantity and quality of the remediation validation undertaken is adequate to characterise the nature and extent of contamination at the site. The Auditor considers the data collected are sufficient for the purposes of this environmental audit.

8 Beneficial Use Assessment – Land

8.1 Final Soil Condition

The final soil condition at the site is characterised by the soil samples collected that remain on site, which includes both the residual soils within Lot B, the spoil which was reused on site and imported fill. The data has been separated into:

- Table 13: in situ results representative of natural conditions. The hotspot location TP09 removed by Agon and asbestos results have not been included here as it is considered that the asbestos has been removed and validated in stockpile and during backfill;
    - Greencap (June and August 2019) n=28
    - Greencap (September 2019) n=28
    - Agon (November and December 2019) n=13
- Table 14: validation results from the surface and walls of the excavation and trenches (resulting from the removal of underground services). This table includes boundary samples where some asbestos remains, any asbestos identified during validation was removed and revalidated. Only validation samples are included in this table (i.e. no historical results) as the surface soils on site have been excavated, and therefore the validation results are considered representative of final site conditions. Note that OPPs, PAHs and TRH/BTEXN were analysed but reported below LORs, and therefore not included in the table below.
    - B1 – Validation sampling by SLR (September 2021) (93 samples collected of which 46 were analysed)
    - B2 – Validation sampling by SLR (September 2021) (197 samples collected of which 126 were analysed)
    - B3 – Validation sampling by SLR (September 2021) (180 samples collected of which 115 were analysed)
- Table 15: Stockpile results for soils reused on site STP1 to 32 (6,292 m^3) and soils imported to site STP-A to C (95 m^3). Note that OPPs, PAHs, PCBs and TRH/BTEXN were analysed but reported below LORs, and therefore not included in the table below:
    - STP1 (n=3, 60 m^3)
    - STP2 (n=8, 360 m^3)
    - STP6 (n=6, 375 m^3)
    - STP7 (n=8, 450 m^3)
    - STP10A (n=6, 365 m^3) – the chemical results from parent stockpile STP10 (excluding asbestos) have been included in the table below as only asbestos was analysed was part of verification works
    - STP11 (n=6, 390 m^3)
    - STP13 (n=6, 120 m^3)
    - STP15A (n=6, 367 m^3)
    - STP17 (n=5, 350 m^3)
    - STP18 (n=6, 375 m^3)
    - STP19 (n=3, 50 m^3)
    - STP20 (n=8, 560 m^3)
    - STP22 (n=7, 80 m^3) – data is for absence/presence of asbestos only as spoil was generated when removing utility service lines
    - STP24 (n=5, 400 m^3)
    - STP25 (n=4, 270 m^3)
    - STP26 (n=7, 450 m^3)
    - STP27 (n=5, 335 m^3)
    - STP28 (n=6, 390 m^3)
    - STP29 (n=3, 60 m^3)

- STP30 (n=6, 420 m^3)
- STP31 (n=3, 65 m^3)
- STP32 (n=3)
- STP-A (n=3, 14 m^3)
- STP-B (n=3, 25 m^3)
- STP-C (n=5, 56 m^3)

Reported exceedances of the adopted soil quality objectives are summarised in the following tables.

Table 13: Residual Soil Analytes Comparison with Ecological/Human Health Direct Contact Criteria (mg/kg)

The asbestos assessment works was described in Sections 6.1 and 7.3 of this EAR. In summary, bonded ACM and friable asbestos was identified in fill soils on site with fill up to approximately 0.4 mbgl to a maximum depth of 1.8 mbgl. As part of the earthworks within Lots B1, B2 and B3 the fill was excavated and either temporarily stockpiled, loaded directly into skips or side cast on site. All surface fill was removed from site during the bulk excavation works, the spoil generated during removal of the sewer (i.e. bedding sands and (reworked) natural) was side cast and once cleared of asbestos was used to backfill the trench. The excavation generally extended to natural or inferred (reworked) natural (maximum depth of 0.3 m). Asbestos was not observed at the excavation surfaces, or where it was observed it was removed and validated.

The presence of asbestos was detected at one residual location in the south-eastern corner of B2 which was identified during trenching works for the removal of the sewer which runs along the southern boundary. The asbestos was observed in the soil remaining at the property boundary. The soil could not be excavated further at this location as it was geotechnically unsafe, and could undermine the adjacent property. The wall was excavated to the extent practicable, and geofabric was placed over the eastern wall, to a depth of approximately 1.2 mbgl, to prevent asbestos fibres/ACM debris was falling into the site and as a marker layer. Figure 9 shows the location of the geofabric.

ACM was also observed beyond the site boundary to the north, which was removed during trenching works. As the asbestos was located beyond the site boundary it was considered that placement of geofabric was not necessary. However, there is potential for future excavation to result on drag back of asbestos onto site.

8.1.1 Maintenance of Ecosystems (MoE)

Concentrations of copper were reported in one soil sample above the adopted ecosystem criteria for urban residential and commercial/industrial use. The exceedance (Val-T-50) is located in the wall of the former sewer trench in Lot B3. Statistically this result is not considered significant, as the result is marginally above the criteria (113 mg/kg compared to 70 mg/kg), is surrounded by samples which did not the presence of elevated copper concentrations, and it is one sample out of 214 (0.5%) validation samples tested for copper from across the site. Based on the isolated exceedance, absence of visual indications of contamination observed, low concentration reported the exceedance is considered trivial.

The current soil condition is not considered detrimental to the MoE beneficial use, under an unrestricted land use.

8.1.2 Human Health

Following the remediation works, all visible asbestos was removed. The surface of the site, hotspots and stockpiles were chemically validated for asbestos, all asbestos results were reported below criteria.

However the presence of asbestos on the site boundary (south-eastern corner of B2) and beyond the site boundary (north of the site) indicate the potential for small quantities of ACM to remain within the soil and be uncovered during excavation works. These ACM fragments are not anticipated to represent a health risk to workers or occupiers of the completed development.

All other chemicals reported concentrations below the adopted human health criteria for residential land use.

On the basis of the Tier 1 screening results, the Auditor considers that the condition of the site is detrimental to some of the relevant beneficial uses defined in SEPP (Land), i.e. *Protection of Human Health*, due to asbestos risks in fill materials present on and in the near vicinity of the site boundary. However, the condition of the site is acceptable for the beneficial uses of '*Sensitive use – High Density*, '*Public Open Space*', *'Commercial' and 'Industrial*'.

8.1.3 Aesthetics

Near surface soils comprised inclusions of building rubble (concrete, plastics, scrap metal, ceramic tiles). These soils were excavated to approximately 0.3 m (and up to 2 m in places), and the geotechnically unsuitable construction and demolition rubble was screened from the stockpiled soil. Stockpiles were visually inspected for evidence of ACM.

Asbestos containing materials (ACM) have been identified within fill materials on the external eastern site boundary for a portion of Lot B2. A geofabric marker layer has been installed along this portion of the site as shown in Figure 9 and extends from the surface to a depth of approximately 1.2 mbgl.

No hydrocarbon odours or staining was identified in the sample locations, with field screening of soil samples for volatile organic compounds recording low concentrations.

Given the removal of the fill, and screening of geotechnically unsuitable materials, the current condition of the site is not considered detrimental to the objectives of this beneficial use, subject to implementation of the Audit Conditions in Section 13.3.

8.1.4 Production of Food, Flora and Fibre

The residual fill material contains one copper exceedance for protection of urban ecosystems. The exceedance was located in the wall of the former sewer trench. Based on the isolated exceedance, absence of visual indications of contamination observed, low concentration reported the exceedance is considered trivial.

The current soil condition is not considered detrimental to the MoE beneficial use, under an unrestricted land use.

8.1.5 Buildings and Structures

Overall, the soil condition for the beneficial use of buildings and structures was considered to be 'non-aggressive to mild' in accordance with AS2159-2009, based on the following soil results:

1. pH results ranging from 6.3 – 7.8 pH units; and
2. the site is located in an area of potential acid sulfate soil.

TRHs were all reported below the management limits, indicating that buried infrastructure is unlikely to be adversely impacted by the hydrocarbon concentrations.

There is potential that Acid Sulfate Soils (ASS) may impact on deep building footings due to its natural salinity, acidity, sulfate content, corrosiveness and/or encrustation potential, but is not considered a risk to the development.

The Auditor therefore considers that the condition of the site is potentially detrimental to the objectives of this beneficial use for deep structure.

8.2 Consideration of Whether a Certificate or Statement Should be Issued

Groundwater pollution has not been identified at the site and therefore groundwater does not prevent the issuing of a Certificate of Environmental Audit. However, the final soil condition is considered to be detrimental to some beneficial uses of land. Therefore a Certificate of Environmental Audit cannot be issued.

8.3 Determination of Whether the Condition of the Site is Detrimental to the Proposed Development

The Auditor considers that the condition of the site soil is not detrimental to the proposed residential development, provided excavation works on the site boundary in the vicinity of the marker liner and cross boundary excavation works along the external site boundary do not bring ACM contaminated fill onto the audit site. This is considered an unavoidable situation as the contamination is off site and does not unreasonably constrain the site use. This can be reasonably managed post-development via compliance with Statement conditions.

The condition of groundwater is not considered detrimental to the proposed development.

9 Beneficial Use Assessment – Groundwater

9.1 Groundwater Pollution Assessment Process

The Auditor has followed the process for assessing groundwater pollution provided in Section 13 of EPA Publication 759, whereby the Auditor must answer the following questions:

1. Is groundwater likely to be polluted?
2. Is groundwater polluted?
3. Are the beneficial uses of the groundwater precluded by the pollution relevant, or, is the site the source of pollution?

9.1.1 Is Groundwater Likely to be Polluted?

The site was formerly used for residential purposes. Imported fill was a potential source of groundwater pollution. In addition, a number of nearby properties were potential or known sources of groundwater pollution, including multiple service stations, as detailed in Section 3.2. Based on these considerations, pollution of groundwater was considered a possibility and intrusive groundwater investigation was warranted.

9.1.2 Is Groundwater Polluted?

The discussion in the following section presents the Auditor's assessment of whether the groundwater is polluted or not. That is, do elevated concentrations in groundwater (above naturally occurring levels) exceed allowable levels for the protected beneficial uses of groundwater?

The aquifer is classified as Segment A1, with the following beneficial uses of groundwater to be protected:

- Water Dependent Ecosystems and Species;
- Potable Water Supply (Desirable);
- Potable Mineral Water Supply (considered not relevant as the site is not within a designated mineral water area);
- Agriculture and Irrigation (Irrigation);
- Agriculture and Irrigation (Stock Watering);
- Water-based Recreation (Primary Contact Recreation);
- Industrial and Commercial;
- Traditional Owner Cultural Values;
- Cultural and Spiritual Values;
- Geothermal Properties (considered not relevant as the groundwater in this area was not found to have geothermal properties); and
- Buildings and Structures.

Based on the groundwater investigations undertaken, concentrations exceed screening criteria for some of these beneficial uses. Although some of the analytes are considered naturally occurring (cobalt, copper, nickel, lead, manganese and zinc). This is further discussed in Section 9.2.3.1

9.1.3 Are Precluded Beneficial Uses Relevant or is the Site the Source?

The site is not considered a source of groundwater pollution, as discussed in Section 9.33.1.

The risk the groundwater pollution presents to the beneficial uses and the relevancy of those beneficial uses are discussed in Section 9.4.

A summary of the precluded beneficial uses of groundwater due to the groundwater pollution is discussed in Section 9.55.

9.2 Final Groundwater Condition

The most recent groundwater monitoring event (GME) was undertaken in January 2020. Given the soil contamination was not related to the elevated groundwater concentrations (i.e. different contaminants) and active groundwater remediation was not undertaken (off-site source), rebound or long term monitoring of groundwater was not necessary.

Concentrations present in groundwater exceeding the adopted assessment criteria for the protected beneficial uses are summarised in the following table and based on the latest sampling event, where data was available.

It is noted that some low level concentrations of TRH and chloroform were reported in MW01 and MW02 (closest to the off-site service station). MW01 was re-tested using silica gel clean up methodologies. The silica gel clean up results were reported to be below limit of reporting (LOR). The chloroform results were compared to WHO drinking water guidelines, and found to be below this criteria (6 and 10 µg/L for MW01 and MW02 respectively, compared to a criteria of 300 µg/L); the chloroforms are likely a result of leaking mains water.

Table 16: Groundwater Results Exceeding Adopted Tier 1 Criteria

Location	Contaminant (mg/L)	Tier 1 Criteria exceeded* (mg/L)
MW1	Cobalt (0.006)	MWG (0.001)
	Copper (0.017)	MWG (0.0013)
	Lead (0.035)	DWG (0.01) MWG (0.0044) FWG (0.0034)
	Manganese (0.21)	RWG (0.1) LIWG (0.2)
	Nickel (0.12)	DWG (0.02) MWG (0.07) FWG (0.011) RWG (0.1)
	Zinc (0.26)	MWG (0.015) FWG (0.008)
	pH (6.1)	RWG (6.5-8.5)
MW2	Cobalt (0.002)	MWG (0.001)
	Lead (0.009)	MWG (0.0044) FWG (0.0034)
	Manganese (0.19)	RWG (0.1)
	Nickel (0.009)	FWG (0.011)
	Zinc (0.044)	MWG (0.015) FWG (0.008)
	pH (6.2)	RWG (6.5-8.5)

Location	Contaminant (mg/L)	Tier 1 Criteria exceeded* (mg/L)
MW3	Cobalt (0.005)	MWG (0.001)
	Copper (0.006)	MWG (0.0013)
	Lead (0.005)	MWG (0.0044) FWG (0.0034)
	Manganese (0.14)	RWG (0.1)
	Nickel (0.025)	DWG (0.02) FWG (0.011)
	Zinc (0.093)	MWG (0.015) FWG (0.008)
	pH (4.5)	RWG (6.5-8.5)
MW4	Cobalt (0.002)	MWG (0.001)
	Copper (0.004)	MWG (0.0013)
	Lead (0.002)	FWG (0.0034)
	Nickel (0.016)	FWG (0.011)
	Zinc (0.034)	MWG (0.015) FWG (0.008)
	pH (4.9)	RWG (6.5-8.5)

*Adopted Criteria detailed in Section 5.4:
MWG – marine water guidelines – 95% protection
FWG – freshwater guidelines – 95% protection
DWG – drinking water guidelines
RWG – recreational water guidelines
LIWG – Livestock/Irrigation water guidelines

9.3 Source and Extent of Groundwater Pollution

The assessor did not present a quantitative comparison of elevated groundwater analytes on site with regional data, and therefore this comparison was undertaken by the Auditor.

9.3.1 Background/Regional Pollution

The concentrations of pH, cobalt, copper, nickel, zinc, lead and manganese were above one or more assessment criteria during the GME. A comparison of the up-gradient and down-gradient groundwater exceedances are summarised in the table below. These analytes are not considered site-derived pollution for the following reasons:

- The concentrations of metals and pH were present at levels which may be attributed to naturally occurring aquifer conditions;
- These analytes were not identified as key site-sourced contaminants of concern within the site history; and
- Concentrations of these analytes in soil during site investigation, excavation and remediation/validation works were not indicative of an obvious on-site source.

Therefore, the Auditor considers that the site is not a source or co-source of pH, cobalt, copper, nickel, zinc, lead and manganese pollution in groundwater but indicative of the natural groundwater conditions surrounding the site.

The groundwater investigation was undertaken to understand if there was contamination present beneath the site from up-gradient off-site sources. Concentrations of petroleum hydrocarbon and volatile were not identified at concentrations indicative of a risk to site users.

Table 17: Summary of groundwater contaminant exceedances

Analyte	On-site concentration range (µg/L)		Guidelines values for protected beneficial uses* (µg/L)					Bore/s Exceeding Criteria
	Up-gradient (MW01 to MW03)	Down-gradient (MW04)	MWG	FWG	DWG	RWG	IWRG	
Analytes considered by the Auditor to be natural and hence not pollution								
Cobalt	**6**	**2**	**1**	**-**	-	-	**10**	MW01, MW02, MW03, MW04
Copper	**17**	**4**	**1.3**	**1.4**	2,000	1,000	200	MW01, MW03, MW04
Lead	**35**	2	**4.4**	**3.4**	**10**	50	2,000	MW01, MW02, MW03
Manganese	**210**	32	-	1,900	500	**100**	**200**	MW01, MW02, MW03
Nickel	**120**	**16**	**70**	**11**	**20**	**100**	200	MW01, MW02, MW03, MW04
Zinc	**260**	**34**	**15**	**8**	3,000	5,000	2,000	MW01, MW02, MW03, MW04
pH	**4.5**	**4.9**	-	**-**	**6.5 – 8.5**	**6.5 – 8.5**	**6 – 8.5**	MW01, MW02, MW03, MW04

*Adopted Criteria detailed in Section 5.4:
MWG – marine water guidelines – 95% protection
FWG – freshwater guidelines – 95% protection
DWG – drinking water guidelines
RWG – recreational water guidelines
LIWG – Livestock/Irrigation water guidelines

9.4 Significance (Risk) of Groundwater Pollution

9.4.1 Extractive Groundwater Uses

Based on Segment A1, protected extractive uses of groundwater include potable water supply, primary contact recreation, irrigation, stock watering and commercial and industrial use. As per Section 13.7 of EPA Publication 759, the relevancy of beneficial uses only needs to be considered at the site, for non-source sites.

The proposed development will not include any extractive use of groundwater. It is also noted that extractive use on site in the future is unlikely, based on the natural aquifer characteristics (relatively low yield and concentrations of inorganics and metals), availability of mains water, highly urbanised site location and the building footprint (covering the majority of the site).

9.4.2 Water Dependent Ecosystems and Species, Traditional Owner Cultural Values, Cultural and Spiritual Values

Concentrations of cobalt, copper, nickel, zinc and lead exceeded the WDES criteria on site. Concentrations were considered naturally occurring and do not represent pollution.

The groundwater quality objectives for WDES apply at the point of discharge to surface water and no surface water bodies exist on site. The Auditor considers that in the case where groundwater is not proposed to be extracted, TOCV and CSV should also be applied at the point of discharge. Furthermore for non-source sites, as per Section 13.7 of EPA Bulletin 759, off-site beneficial uses do not need to be

considered when evaluating potential impacts of groundwater pollution, and therefore these beneficial uses are not relevant at this site.

9.4.3 Other Non-Extractive Groundwater Uses

Based on the depth to groundwater, the only relevant on-site non-extractive groundwater use relates to building foundations that may extend into groundwater, that is Buildings and Structures. As per Section 13.7 of EPA Bulletin 759, for non-source sites the relevancy of beneficial uses only needs to be considered at the site.

Groundwater is classified as 'non-aggressive to mild' based on AS2159-2009 and therefore Buildings and Structures is not a precluded beneficial use, based on the following:

- pH in groundwater ranged from 4.5 to 6.1 pH units and is considered slightly acidic;
- Chloride in groundwater ranged from 16 to 190 mg/L and was considered to be naturally occurring; and
- Sulfate (as SO_4) concentrations in groundwater ranged from 17 to 56 mg/L and were considered to be naturally occurring.

9.4.4 Consideration of Potential NAPL

No measurable NAPL or sheen has been reported for groundwater from on-site or off-site wells.

9.4.5 Consideration of Potential Vapour Risks

There were no detectable concentrations of volatile contaminants.

9.5 Summary of Precluded Beneficial Uses of Groundwater

A summary table of the currently precluded beneficial uses is provided in Table 18: below and is consistent with Attachment 3 of EPA Publication 840. As the concentrations of potential contaminants in groundwater are considered to be natural, uses of groundwater can not be precluded, but should still be proven to be safe for that proposed use as concentrations exceed some adopted criterion.

Table 18: Precluded Beneficial Use Summary Table

Precluded Beneficial Use	Contaminants
Water Dependent Ecosystems and Species[1]	Cobalt (n), copper (n), lead (n), nickel (n), zinc (n)
Potable Water Supply	Lead (n) and nickel (n)
Potable Mineral Water Supply	Not Applicable at this site
Agriculture and Irrigation (Irrigation)	Manganese (n)
Agriculture and Irrigation (Stock Watering)	None
Water-based Recreation (Primary Contact Recreation)	Manganese (n) and pH (n)
Industrial and Commercial[2]	None
Traditional Owner cultural values[1]	Refer to WDES – not applicable on site
Cultural and spiritual values[1]	Refer to WDES – not applicable on site
Geothermal Properties	Not applicable at this site
Buildings and Structures	Not precluded

(n) naturally occurring
1 Based on concentrations in the vicinity of the site, whilst criteria apply at the point of exposure/receptor.
2 No chromium criteria are available for commercial or industrial use, as suitability for these uses are highly dependent on the specific use proposed. It is recommended that suitability for a specific commercial or industrial use is evaluated on an individual basis.

9.6 Determination of Whether a Certificate or Statement Should be Issued

Groundwater pollution has not been identified at the site and therefore groundwater does not prevent the issuing of a Certificate of Environmental Audit. Soil contamination is detrimental to the beneficial uses of land and therefore a Certificate of Environmental Audit cannot be issued.

9.7 Determination of Whether the Condition of the Site is Detrimental to the Proposed Development (Statement of Environmental Audit)

The proposed development does not propose extractive use of groundwater, and groundwater pollution has not been identified therefore, the condition of groundwater is not considered detrimental to the proposed development.

10 Beneficial Use Assessment – Surface Water

The Auditor considers that the current condition of the site is not detrimental to the relevant beneficial uses of surface water on the basis that:

1. There are no surface water bodies located within the boundaries of the site;
2. Erosion of surface soils is unlikely due to the effective capping of the site once the proposed development is constructed; and
3. The potential receiving waters (mangrove community of the Outer Estuary of Darwin Harbour) are located approximately 160 m away, and the processes of dispersion and sorption would act to reduce the contaminant levels.

Based on the above, the Auditor considers that the condition of the site is not detrimental to the beneficial uses of surface water defined in SEPP (Waters).

11 Beneficial Use Assessment – Ambient Air

The Auditor has assessed whether or not the site is detrimental to ambient air (defined as air outside a building) on the basis of:

1. Land pollution, specifically vapour emissions from polluted soils (i.e. volatile hydrocarbons in soil and soil vapours) and landfills;
2. Groundwater pollution, specifically vapour emissions from polluted groundwater (i.e. volatile hydrocarbons dissolved in groundwater and NAPL); and
3. Surface water pollution, specifically vapour emissions from polluted surface waters.

The risks to on-site receptors from vapour emissions into ambient and indoor air is within acceptable levels for the proposed development based on the results of soil and groundwater investigations.

In accordance with EPA Publication 788, the Auditor is required to consider the presence of open and closed landfills within 500 m of the site and assess the risk of any resultant landfill gas impacts. No landfills were identified within 500 m of the site.

Based on the above, the Auditor considers that the condition of the site is not detrimental to the beneficial uses of air defined in SEPP (Air Quality Management) and SEPP (Ambient Air Quality).

12 Other Factors Affecting Use of the Site

EPA Publication 759 notes that a range of other factors (other than land, groundwater, surface water and air) may be identified that do not affect a beneficial use of the site, but may be relevant to the development of, or activities at, the site. Such factors are noted below and repeated in the Statement of Environment Audit in the section titled "Other Related Information":

1. ACMs were found on the audit site and have been removed as far as reasonably practicable. No known ACM remains on the audit site. However, small quantities of ACM may remain within the soil and be uncovered during excavation works. These ACM fragments are not anticipated to represent a health risk to workers or occupiers of the completed development. If encountered during future development or use of the audit site, any fragments must be handled and disposed in accordance with the *Code of Practice How to Safely Remove Asbestos 2011* (or its relevant future revisions).
2. Groundwater at the site contains naturally elevated concentrations of pH, cobalt, copper, nickel, lead, manganese and zinc. The levels are considered typical of the natural groundwater quality surrounding the site and do not constitute pollution in accordance with clause 10(2)(c) of State Environment Protection Policy (Waters) 2018.
3. If groundwater is to be extracted from the site advice, including testing, should be sought from a suitably qualified professional to ensure the groundwater is suitable for the intended use.
4. Any material excavated from the site and disposed of off site should be classified and managed in accordance with IWRG 621 (or its relevant future revisions) or NT EPA equivalent. Analysis of fill materials should include asbestos and PFAS due to the previous on-site asbestos contamination and importation of fill materials from a Defence site;
5. Not all land uses for which the land is considered suitable by this audit may be allowed under the existing zoning;
6. A separate Environmental Audit Report and Statement of Environmental Audit has been issued for Lot A (dated 31 March 2022) and another report will be issued for the Road Reserve and Lot C; and
7. In accordance with Section 53ZE of the Act, the owner/occupier of the site must provide a copy of this Statement to any person who becomes or proposes to become an occupier of the site.

13 Conclusions

13.1 Audit Requirement

This audit was requested by the NT EPA to assess the suitability of the site for the proposed use. The proposed development is for high density residential land use; refer to Attachment 2 for the development plan.

13.2 Verification of Assessor's Conclusions

Appendix 3 of EPA Publication 759 states that, '*Where another person has undertaken the site assessment, the audit report should include the auditor's verification of the assessor's conclusions in relation to these issues.*' Among SLR and Agon's conclusions are the following:

- *DIPL commenced demolition of former public housing buildings in mid-2019.*
- *Fill was observed to approximately 0.4 mbgl, with deeper pockets up to 1.8 mbgl, overlying natural weathered rock or rock. At the completion of works all fill was removed, with natural or reworked natural soils remaining.*
- *Investigations of the site identified contamination in the form of asbestos (bonded fragments and fibres) and pesticides (aldrin and dieldrin) in soils.*
- *SLR developed a remediation strategy for the site. Removal of surface fill (excavation to inferred natural) and placement directly into skips for off-site disposal. Following removal of the surface fill the deeper reworked natural soil and bedding sands (around trenches) was removed along with the underground utilities, visually expected for asbestos before placed back in the trench once the surface and soils were visually inspected to be free of asbestos. ACM debris was removed for off-site disposal.*
- *A combination of imported soil and re-use of site-sourced soils were reused to backfill the excavation on site. SLR tested the soil prior to importation, and it was found to be suitable for use on site.*
- *SLR supervised the removal of fill across the site; the presence of asbestos was only detected at one residual location in the south-eastern corner of B2, where the asbestos could not be removed as it was a boundary location and it was unsafe to excavate further. The wall has been excavated to the extent practicable, and geofabric has been placed over the eastern wall to prevent asbestos fibres/ACM debris falling into the site and as a marker layer. The location is shown in Figure 9.*
- *SLR consider that the site has been suitably remediated and validated for the proposed residential use.*
- *Agon found that the soil investigations identified fill up to 2 m, consistent with reworked natural soils. Bonded ACM fragments and fibres were identified in the soil, with concentrations of OCPs exceeding residential criteria (below commercial criteria). The surface fill was excavated from Lots B1, B2 and B3 and removed from site; deeper bedding sands and reworked natural excavated during trenching works were inspected, visible asbestos removed, and validated to be free of asbestos before re-using to backfill the excavation.*
- *Agon reported concentrations of TRH, ether oxygenates, BTEX and halogenated volatile organics within groundwater were below the adopted assessment criteria; minor concentrations of chloroform were detected in groundwater. Some metals were reported to exceed site-specific criteria.*

The Auditor generally concurs with the above findings.

13.3 Auditor's Conclusions

The Auditor considers that the final condition of the site is detrimental to some of the relevant beneficial uses defined in SEPP (Land), i.e. *Protection of Human Health*, due to asbestos risks in fill materials present

on and in the near vicinity of the site boundary. However, an SEA which states that the condition of the site is acceptable for the beneficial uses of '*Sensitive use – High Density*, '*Public Open Space*', *'Commercial' and 'Industrial*' can be issued, subject to the SEA conditions.

The Auditor considers that the condition of the site is not detrimental to the relevant beneficial uses defined in SEPP (Waters) for groundwater and surface water, SEPP (Air Quality Management) and SEPP (Ambient Air Quality).

Appendices

Appendix A
EPA Summary Information

NOTIFICATION OF COMPLETION AND ISSUE OF STATEMENT OR CERTIFICATE OF ENVIRONMENTAL AUDIT

The following *pro forma* must be used by auditors when notifying EPA of the completion and issue of a statement of environmental audit or a certificate of environmental audit. This *pro forma* should be forwarded electronically (in .docx and .pdf format).

8 September 2022
Manager – Environmental Audit
EPA Victoria
GPO Box 4395
MELBOURNE, 3001

I, Jean Paul Pearce, a person appointed as an environmental auditor (contaminated land) by the Environment Protection Authority under s. 53S of the *Environment Protection Act 1970* (Vic.), have completed an environmental audit and issued a certificate/statement (*select appropriate*) of environmental audit for the site located at (*insert site address as per SoEA/CoEA*). Details are as follows.

Auditor	Jean Paul PEARCE
Auditor account number	101292
Auditor appointment end date	26 November 2022
Auditor's appointment category	CL
Audit Type	53X (site suitability audit)
Date EPA notified of audit	21 November 2019
Audit service order number	PRL8565 (NTEPA2019/0099-199)
Name of person requesting audit	Ms Sinead Redmond Project Management Lead Northern Territory Department of Infrastructure, Planning and Logistics Land Development Unit sinead.redmond@hksolutions EPA customer account number (if available). – n/a
Relationship of person requesting audit to site	Authorised representative of site owner
Name of premises owner	DIPL Representative Project Manager
Date of auditor engagement	20/11/2019
Completion date of the audit	1/04/2020
Reason for Audit	Due to the identified pesticide and asbestos contamination, we understand EPA has required an Auditor to determine the site is suitable for use;
Audit Categorisation	Risk
Environmental Segments	Air, Land, Groundwater, Surface water
If the audit was required by an EPA notice, licence or other, please provide EPA reference number	n/a
Current land use zoning	Zone MR (medium density residential), recently changed to Specific Use (SU) Zone SD49.
EPA Region	Darwin
Municipality	Nightcliff
Dominant Lot on title plan	Lot 9077 Town of Nightcliff Lot 9077 has since been subdivided creating Lot 12840 (Lot B1), Lot 12842 (Lot B3) and Lot 12843 (Lot B2)

Additional Lot on title plan(s)	The project area has been split into three audit areas based on the proposed development. This audit is the second audit area (Stage 2 of 3 stages) and comprises three residential lots referred to as Lot B1, B2 and B3 (referred to as Lot B) Lot B is defined as Lot 12840 (Lot B1), Lot 12842 (Lot B3) and Lot 12843 (Lot B2).
Site/Premises name	John Stokes Square Nightcliff Development
Building/complex sub-unit/lot No.	--
Street/Lot – Lower No.	47
Street/Lot – Upper No.	
Street Name	Progress,
Street type (road, court, etc)	Drive
Street suffix (North, South etc)	--
Suburb	Nightcliff
Postcode	0810
GIS Coordinate of Site centroid[1] Latitude (GDA94)	-12.388587°
Longitude (GDA94)	130.850751°
Site area (in square metres)	8,985 m^2
Plan of site/premises showing the audit site boundary attached	Yes
Plan of site/premises showing the audit site boundary attached in a spatial data format	No
Members and categories of support team utilised	Shandel Coleman (internal audit support). Bridget Roder (internal audit support).
Further works or requirements	No
Nature and extent of continuing risk	Risks in groundwater have not been found to be significant, however the condition of the groundwater should be tested by an appropriately qualified environmental consultant (to determine the suitability thereof) prior to being utilised for extractive use. Risks in soil vapour have not been found to be significant. Risks in soil have not been found to be significant apart from residual ACM on the site boundary covered by a geofabric marker liner and slightly beyond the site boundary. This is not a risk to future site users, but excavation workers in the area should be aware of this. This is located within a PWC sewer easement and excavation works are therefore restricted to PWC accredited contractors who would be familiar with and have procedures in place to deal with asbestos finds.
Outcome of the audit	Statement of Environmental Audit with conditions
Has EPA determined CUTEP at this site?	No
Has the Auditor determined CUTEP at this site?	No
Has a GQRUZ been identified at	No

[1] Longitude and latitude (decimal degrees) co-ordinates in the 1994 Geocentric Datum of Australia (GDA94) is required to six decimal places.

the site/beyond the site by EPA?	
Does NAPL remain at the site?	No – never encountered

<table>
<tr><td>Please indicate which of the Protected Beneficial Uses of groundwater are precluded due to pollution</td><td>e.g. including site-sourced and regional pollution.<table>
<tr><th>Protected Use</th><th>Precluded?</th></tr>
<tr><td>Maintenance of Ecosystems</td><td>No</td></tr>

<tr><td>Potable Water Supply (Acceptable)</td><td>No</td></tr>
<tr><td>Potable Mineral Water Supply</td><td>N/A</td></tr>
<tr><td>Agriculture, Parks and Gardens</td><td>No</td></tr>
<tr><td>Stock Watering</td><td>No</td></tr>
<tr><td>Primary Contact Recreation</td><td>No</td></tr>
<tr><td>Industrial water use</td><td>No</td></tr>
<tr><td>Buildings and Structures</td><td>No</td></tr>
</table></td></tr>
</table>

Historical land use	Residential
Current land use	Recently redeveloped for residential properties
Proposed future land use	High density residential
Surrounding land use – north	The police station (Lot A) north of Lot B1 and existing offsite residential north of Lot B2 and B3. Progress Drive then commercial, with low density residential beyond A service station is located to the north-east of the site
Surrounding land use – south	Proposed public open space (Lot C) Child care centre and tyre retailer then commercial A service station is located south-east of the site
Surrounding land use – east	Road Reserve, proposed residential (Lot B3), then Dick Ward Drive
Surrounding land use – west	Proposed residential (Lot B1), Lot A, vacant land and laneway then commercial
Proposed land use zoning	Specific Use (SU) Zone SD49
Nearest surface water receptor – name	Outer Estuary of Darwin Harbour
Nearest surface water receptor – distance (m)	160 m
Nearest surface water receptor – direction	West
Likely point of groundwater discharge	Outer Estuary of Darwin Harbour, 160 m west of the site
Site aquifer formation	Unconsolidated soils
Groundwater flow direction	West
Groundwater TDS range (mg/L)	120 to 430 mg/L
Groundwater Segment	Segment A1
Are there multiple aquifers impacted by pollution at the site	n/a
Perched groundwater depth – upper (metres below ground level (mbgl))	n/a

Perched groundwater depth – lower (mbgl)	n/a

Regional groundwater depth – upper (mbgl)	6
Regional groundwater depth – lower (mbgl)	10
Number of bores within 2 km	46
Closest extractive use (distance in m)	Bore RN000130 (300 m from the site).
Zone of groundwater plume influence (m from site boundary)	Not applicable – non-source site
Year groundwater last monitored	2020
Have you attached electronic copies of Current Groundwater Analytical Results presented as a summary table?	Yes, refer to Appendix A

In notifying EPA of the completion of an environmental audit and issuing of a statement of environmental audit, I state that:

I am not aware of any conflict of interest that would preclude me from completing the environmental audit or issuing a certificate/statement (*select appropriate*) of environmental audit for the above site.

I have not had prior involvement in any assessment or cleanup works at the site, which would preclude me from completing the environmental audit or issuing a certificate/statement (*select appropriate*) of environmental audit for the above site.

Yours sincerely,

Signed: _____

JEAN PAUL PEARCE

ENVIRONMENTAL AUDITOR

BASIS OF REPORT

This report has been prepared by SLR Consulting Australia Pty Ltd (SLR) with all reasonable skill, care and diligence, and taking account of the timescale and resources allocated to it by agreement with HK Solutions on behalf of Department of Infrastructure, Planning and Logistics (the Client). Information reported herein is based on the interpretation of data collected, which has been accepted in good faith as being accurate and valid.

This report is for the exclusive use of the Client. No warranties or guarantees are expressed or should be inferred by any third parties. This report may not be relied upon by other parties without written consent from SLR.

SLR disclaims any responsibility to the Client and others in respect of any matters outside the agreed scope of the work.

Executive Summary

The Department of Infrastructure, Planning and Logistics (DIPL), through Project Management Consultants HK Solutions Pty Ltd, have engaged SLR Consulting Australia Pty Ltd (SLR) to provide environmental consultancy services relating to the redevelopment of John Stokes Square, located at 47 Progress Drive, Nightcliff, Darwin, Northern Territory (herein referred to as the "Project Area").

The Project Area is planned to be subdivided as part of the redevelopment project, with varying land use classifications including high density residential, public open space, community and commercial. Works were undertaken across the Project Area to characterise, remediate and validate the newly defined land parcels to ensure suitability for the proposed land uses.

This report outlines the remediation and validation works that were undertaken for proposed allotments Lot B1, Lot B2 and Lot B3 (herein referred to as the "Site"). Results of the remediation and validation works undertaken within other areas of the Project Area are included under separate cover in the reports titled *"Validation Assessment, John Stokes Square Redevelopment, Lot A"* (SLR ref: 680.10679.00100-R02), and *"Validation Report, John Stokes Square Redevelopment, Road Reserve and Lot C"* (SLR ref: 680.10679.00100-R06).

This report has been prepared for endorsement by the appointed Auditor (*as defined in Part 9 of the Waste Management Pollution Control Act, 1998*) (WMPC Act) for the Site, Jean-Paul Pearce (Australian Environmental Auditor, "the Auditor") and in accordance with the *Northern Territory Contaminated Land Guidelines NT EPA, June 2017, Version 1.0*. The main role of the Auditor is to evaluate the environmental conditions of the Site at the date of signing of the certificate of statement and to form an opinion, on which others can rely, regarding the suitability of the Site for future land uses. In doing so, the Auditor is required to review the environmental site assessment undertaken by environmental consultants in relation to site contamination to confirm the remediation objectives have been met prior to redevelopment of the Site.

All remediation and validation work undertaken at the Site have been completed in accordance with the Auditor's endorsed memorandum: *Remediation Strategy - John Stokes Square - Residential Lots (Lots B1, B2 and B3), ref:680.10679.00000-M04-v2.0* prepared for the Site. Remediation works conducted at the Site involved the following key activities undertaken by SLR -

- Oversaw the stripping and excavation of uncontrolled fill materials to apparent natural soil conditions (either weathered rock or rock) across the Site. Inspected the spoil material and resultant excavation for evidence of any asbestos containing material (ACM) or other contaminants of potential concern (COPC). Based on visual observations, potentially impacted spoil was progressively segregated and stockpiled separately from non-impacted spoil.
- Oversaw the removal of abandoned underground services including stormwater pipes, sewer pipes, electrical cables and pipes, communication cables, water supply network including irrigation and fire hydrant pipes, and visually inspected the services, spoil, and resultant excavations for evidence of ACM or other COPC. Based on visual observations, potentially impacted spoil and services constructed out of ACM were progressively segregated and stockpiled separately from non-impacted spoil.
- Visually inspected and collected validation samples of the remediated areas of the Site (i.e. resultant excavations/trenches). Collated details of the areas remediated including the extent and depth of excavation, validation sample locations, sample identification numbers, date sampled and photographic logs.

- Inspected excavated spoil throughout the screening process for visual evidence of ACM contamination. The earthworks contractor screened geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble from the stockpiled spoil. The screened spoil was then placed into smaller stockpiles and sampled by SLR's environmental consultant for characterisation purposes to inform either beneficial reuse onsite or offsite disposal.
- Oversaw the removal of asbestos impacted stockpiles from the Site by a licenced asbestos removal company for appropriate offsite disposal. SLR's environmental consultant visually inspected and collected validation samples of the surface areas where asbestos material was stored for the purpose of confirming that all ACM had been adequately removed.
- Oversaw the reinstatement of excavated areas on Lots B1, B2 and B3 with spoil characterised as being suitable for reuse onsite. Spoil was reinstated in approximately 200 mm thick lifts. SLR's environmental consultant visually inspected each lift for the purpose of providing ACM clearance certificates.

Even though all known asbestos impact has been removed from the Site, remediation works detailed in this report did not extend into the deeper fill material surrounding the "live" sewer mains that were present at the time of these works. Contractors conducting works associated with the removal/upgrade of these "live" services were advised to employ precautionary measures such as having safe work method statements and/or work-specific management plans addressing exposure to potentially asbestos impacted soils, unexpected finds protocol and associated training, to ensure workers understood the controls required to be implemented in the unlikely event unexpected asbestos was encountered.

Results of the remediation and validation works associated with the removal/upgrade of the sewer main along the eastern and southern boundaries of the Site, that were overseen by SLR, are presented in the addendum report titled *"Sewer Easement Remediation and Validation Report, John Stokes Square Redevelopment, Proposed Residential Lots B1, B2 and B3"*, December 2021 (ref: 680.10679.00200_R13) and should be read in conjunction with this report.

Based on the field observations and analytical results obtained for the remediation and validation works conducted at the Site, SLR considers that Lots B1, B2 and B3 are suitably remediated and validated for the proposed high density residential land use, subject to the considerations outlined in this report.

1 Introduction

The Department of Infrastructure, Planning and Logistics (DIPL), through Project Management Consultants HK Solutions Pty Ltd, have engaged SLR Consulting Australia Pty Ltd (SLR) to provide environmental consultancy services relating to the redevelopment of John Stokes Square, located at 47 Progress Drive, Nightcliff, Darwin, Northern Territory (herein referred to as the "Project Area"). The location of the Project Area is shown in **Figure 1 (Appendix A)**.

The Project Area is planned to be subdivided as part of the redevelopment project, with varying land use classifications, as shown in **Figure 2 (Appendix A)**. Works were undertaken to characterise, remediate and validate the newly defined land parcels to ensure suitability for the proposed future land use.

This report outlines the remediation and validation works that were undertaken for proposed allotments Lot B1, Lot B2 and Lot B3 (herein referred to as the "Site"). Results of the remediation and validation works undertaken within other areas of the Project Area are included under separate cover in the reports titled *"Validation Assessment, John Stokes Square Redevelopment, Lot A"* (SLR ref: 680.10679.00100-R02), and *"Validation Report, John Stokes Square Redevelopment, Road Reserve and Lot C"* (SLR ref: 680.10679.00100-R06).

This report has been prepared for endorsement by the appointed Auditor (*as defined in Part 9 of the Waste Management Pollution Control Act, 1998*) (WMPC Act) for the Site, Jean-Paul Pearce (Australian Environmental Auditor, "the Auditor") and in accordance with the *Northern Territory Contaminated Land Guidelines NT EPA, June 2017, Version 1.0*. The main role of the Auditor is to evaluate the environmental conditions of the Site at the date of signing of the certificate of statement and to form an opinion, on which others can rely, regarding the suitability of the Site for future land uses. In doing so, the Auditor is required to review the environmental site assessment undertaken by environmental consultants in relation to site contamination to confirm the remediation objectives have been met prior to redevelopment of the Site.

All remediation and validation work undertaken at the Site have been completed in accordance with the Auditor's endorsed memorandum: *Remediation Strategy - John Stokes Square - Residential Lots (Lots B1, B2 and B3), ref:680.10679.00000-M04-v2.0* prepared for the Site. The details of the Auditor's advice on previous investigations and a copy of the remediation strategy are included in **Appendix B.**

1.1 Purpose and Objectives

The purpose of this report is to document the remediation and validation works undertaken at the Site to confirm the Site's suitability for high density residential land use with minimal access to soil. Furthermore, it is to ensure that remediation works have been accomplished in accordance with the Remediation Strategy and if so, whether the strategy's objectives have been met.

The objectives of the remediation strategy were as follows:

- Ensure all remedial and development works were undertaken in a manner that does not present an unacceptable risk to human health or the environment.
- Ensure the remedial and development works adhere to all applicable legislative requirements, guidelines, and standards.
- Effectively remediate and manage all identified soil impacts within Lots B1, B2 and B3, enabling the Site to be utilised for its proposed future land use (high density residential).

1.2 Scope of Work

The following scope of works was undertaken by suitably qualified and experienced SLR environmental consultants to meet the objectives of the remediation strategy for Lots B1, B2 and B3.

- Oversaw the stripping and excavation of uncontrolled fill materials to apparent natural soil conditions (either weathered rock or rock) across the Site. Inspected the spoil material and resultant excavation for evidence of any asbestos containing material (ACM) or other contaminants of potential concern (COPC). Based on visual observations, potentially impacted spoil was progressively segregated and stockpiled separately from non-impacted spoil.
- Oversaw the removal of abandoned underground services including stormwater pipes, sewer pipes, electrical cables and pipes, communication cables, water supply network including irrigation and fire hydrant pipes, and visually inspected the services, spoil, and resultant excavations for evidence of ACM or other COPC. Based on visual observations, potentially impacted spoil and services constructed out of ACM were progressively segregated and stockpiled separately from non-impacted spoil.
- Visually inspected and collected validation samples of the remediated areas of the Site (i.e. resultant excavations/trenches). Collated details of the areas remediated including the extent and depth of excavation, validation sample locations, sample identification numbers, date sampled and photographic logs.
- Inspected excavated spoil throughout the screening process for visual evidence of ACM contamination. The earthworks contractor screened geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble from the stockpiled spoil. The screened spoil was then placed into smaller stockpiles and sampled by SLR's environmental consultant for characterisation purposes to inform either beneficial reuse onsite or offsite disposal. In the majority of cases stockpile material was not mixed with other stockpiled material until laboratory result were received, the material classified, and advice provided on appropriate reuse or disposal options.
- Maintained a log of stockpiles generated during the remediation works in a soil tracking spreadsheet. Information collected included stockpile identification number, the origin of the material, stockpile locations, locations of all characterisation samples, stockpile volume, dates of sampling, further segregation (if required based on analytical results) and final destination being either offsite disposal or onsite reuse.
- Oversaw the removal of asbestos impacted stockpiles from the Site by a licenced asbestos waste removal company for appropriate offsite disposal. SLR's environmental consultant visually inspected and collected validation samples of the surface areas where asbestos material was stored for the purpose of confirming that all ACM had been adequately removed.
- Samples were collected and analysed for one or more of the following COPC at a National Association of Testing Authorities (NATA) accredited laboratory.
  - Total Recoverable Hydrocarbons (TRH).
  - Benzene, Toluene, Ethylbenzene and Xylene (BTEX).
  - Organochlorine/ Organophosphate (OC/OP) pesticides.
  - Polycyclic aromatic hydrocarbons (PAHs)
  - Metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc, and mercury).
  - Asbestos (presence/absence and/or AF/FA).

- Comparison of analytical results with relevant investigation levels (ILs) as prescribed in the remediation strategy. In the event validation samples returned results above the nominated ILs, further excavations and validation sampling were undertaken to ensure the Site's remediation objectives were met.
- Oversaw the reinstatement of excavated areas on Lots B1, B2 and B3 with spoil characterised as being suitable for reuse onsite. Spoil was reinstated in approximately 200 mm thick lifts. SLR's environmental consultant visually inspected each lift for the purpose of providing ACM clearance certificates.
- Air quality monitoring for the presence of air borne asbestos fibres was conducted during all remediation and validation works undertaken at the Site.
- Collation of all field notes, photographic logs, certified laboratory reports, soil movement logs, asbestos clearance certificates, waste disposal documentation and air quality monitoring results.
- Preparation of this validation report documenting all remediation and validation works undertaken at the Site.

1.3 Legislative Framework

The soil remediation and validation works were undertaken in accordance with the following regulatory requirements:

- ASC NEPM 2013, National Environmental Protection (Assessment of Site Contamination) Measures 1999, (as amended on 16 May 2013).
- West Australian (WA) Department of Health (DOH) 2009, "Guideline for the Assessment, Remediation and Management of Asbestos - Contaminated Sites in Western Australia".
- Standards Australia AS 4482.1-2005, "Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil. Part 1 Non-volatile and semi volatile compounds".
- New South Wales (NSW) Environmental Protection Authority (EPA) 2014, "Resource Recovery Order under Part 9, Clause 93 of the protection of the Environment Operations (Waste) Regulation 2014- the excavated natural material order 2014".
- NSW EPA 2014b, "Waste Classification Guidelines, Part 1: Classifying Waste".
- Northern Territory (NT) EPA 2017, "Northern Territory Contaminated Land Guidelines".
- NT EPA 2016, "Waste Management and Pollution Control Act".
- Safe Work Australia 2020, "How to manage and control asbestos in the workplace Code of Practice".

2 Background Information

2.1 Site Identification

A summary of the Site identification information is detailed in **Table 1**. Refer to **Figure 1 (Appendix A)** for a plan of the locality surrounding the Project Area and **Figure 2 (Appendix A)** for the extent and boundary definition of the Site (i.e. Lots B1, B2 and B3 areas).

The planned redevelopment of the Project Area will comprise of high-density residential buildings within Lots B1, B2 and B3, a police station within Lot A, and roadways and public open space within the Road Reserve and Lot C. Construction of new and upgraded land servicing infrastructure will be delivered as part of the redevelopment project.

Table 1 Site Information Details

Site information	Details
Site Owner	Northern Territory Government, Department of Local Government Housing and Community Development
Site Address	47 Progress Drive Nightcliff, Darwin, NT
Parcel Reference	Prior to subdivision, Lot 9077 Town of Nightcliff
Project Area Extent (approximate)	18,900 m^2
Lot B1 Area (approximate)	2077 m^2
Lot B2 Area (approximate)	3453 m^2
Lot B3 Area (approximate)	3455 m^2
Current Occupier	DIPL
Current Land Use	Currently unoccupied, under redevelopment
Future Land Use	Police Station (Lot A), High Density Residential (Lots B1, B2 and B3), Road Reserve, Parking and Public Open Space (Lot C)
Current Zoning	Rezoned from Medium Density Residential to Specific Use Zone to facilitate the redevelopment of the broader Project Area for a mix of commercial, community, residential and public open space purposes.
Central GPS Coordinates (latitude and longitude)	-12.388 828°, 130.851 451°

2.2 Surrounding environment

2.2.1 Surrounding Land Uses and Activities

A summary of the properties adjacent to the Project Area at the time of this assessment is detailed in **Table 2**.

Table 2 Summary of Surrounding Land Uses

Direction	Description
North	Progress Drive and a medium residential building, followed by commercial land uses and single dwelling residences.
South	Commercial land use including a childcare centre, shopping centre, service station, followed by single dwelling residences.
East	Commercial land use and medium density residential buildings including a fuel service station, Dick Ward Drive and further single dwelling residences.
West	A vacant lot zoned for commercial use, followed by high-density residential dwellings, vegetation and open water frontage.

2.2.2 Regional Geology

A review of the *Darwin Northern Territory Australian 1:250,000 Geological Series* map (NTDME, 1988) indicated the strata which underlay the Site consisted of unconsolidated sand, ferruginous and clayey, sandy and gravelly soils including pisolitic and mottled laterite from the early period of the Cainozoic era. Additional geological features of the Site included kaolinitic claystone, commonly raiolaria-rich, silty in places, montmorillonite, glauconitic and calcareous when fresh; basal conglomerate, minor bioturbated siltstone, carbonate, sandy claystone and clayey sandstone.

2.2.3 Regional Topography

The *Nightcliff 5073 1:2,500 Topographic Map* (DIPL, 2016) indicated the ground elevation drops approximately 3 metres from the north east corner to the south west corner, towards Darwin Harbour. At the time of this investigation, the proposed redevelopment project and associated remediation works included earthworks across all areas of the Site.

2.2.4 Registered Groundwater Bore Information

A search of the Department of Environment and Natural Resources (DENR) *Natural Resource Maps* online database (DENR, 2018) indicated that eight (8) registered groundwater bores existed within a 500m radius of the centre of the site. Note that information pertaining to the quality of groundwater was not provided within each registered bore report. **Table 3** provides a summary of the location and details of the identified registered bores.

Table 3 Summary of registered bore search

Registered Number	Completion date	Completion depth (mbgl)	Water level (mbgl)	Location
RN038557	24-03-2014	15.4	6	Approximately 85m east of the Project Area boundary
RN001722	Nil	Nil	Nil	Approximately 430m south east of the Project Area boundary
RN038558	25-03-2014	15.8	6	Approximately 85m east of the Project Area boundary
RN001721	Nil	Nil	Nil	Approximately 270m south east of the Project Area boundary
RN000130	03-08-1944	67	9.1	Approximately 110m east of the Project Area boundary
RN008096	23-03-1973	Nil	Nil	Approximately 190m south east of the Project Area boundary
RN005203	03-12-1965	12.2	Nil	Approximately 300m north of the Project Area boundary
RN005204	03-12-1965	12.2	Nil	Approximately 300m north of the Project Area boundary

mbgl = metres below ground level
nil = no information listed

2.2.5 Acid Sulphate Soils

Acid Sulphate Soils (ASS) are a characteristic natural feature of lowland coastal environments in Darwin, particularly where landform elevations are below 5m Australian Height Datum (AHD). ASS contain highly reactive iron sulphides generally in the form of framboidal pyrite. ASS are benign when in a waterlogged state. However, when these soils are drained or excavated, oxygen from the atmosphere reacts with the iron sulphides in the soil resulting in the production of sulphuric acid and the potential release of metal compounds from disturbed soils.

A review of the *Atlas of Australian Acid Sulfate Soils* (CSIRO Land & Water, 2011) indicates that the south western corner of the Site, closest to the marine environment, has a greater probability of encountering ASS than the remainder of the Site. Literature describes the soil in the south western corner as Hydrosols, with the remainder of the Site containing soils described as Kandosol, Tenosols, Podosols, Kurosols and Rudosols, with ASS generally occurring in the upper 1m in wet riparian areas.

Although ASS investigations were not conducted on Lots B1, B2 and B3 specifically, SLR conducted a Detailed Site Investigation (DSI) on the adjacent Road Reserve and Lot C of the Project Area (SLR reference: 680.10679-R03-v2.0). Test pitting conducted during this DSI did not encounter any soils typically associated with lowland coastal environments (e.g., mangrove soils). This observation was further supported by observations made by the geotechnical consultant contracted to undertake works within the Project Area (Douglas Partners, 2020). Elevations across the Project Area range from 8.5m and 10m above AHD, which are above elevations normally considered to pose an acid sulphate soil risk.

2.3 Previous Environmental Investigations

SLR understands that DIPL commenced demolition of former public housing buildings in mid-2019, which were distributed across the Project Area. Majority of demolition waste from the Site was removed and a portion of crushed concrete rubble was screened and spread across the Site as general fill. The EPA raised concerns that pesticides may have been historically used under the building's foundations, and that ACM contaminated fill material may have been historically imported to the Site. As such, the first limited site investigation was undertaken by Greencap Pty Ltd (Greencap) in June 2019 to assess the presence of contamination associated with termite control chemicals at the building block located in the north west corner of the project area, and potential ACM, asbestos fines (AF) and fibrous asbestos (FA) contamination at the footprints of demolished building blocks. Furthermore, a DSI was undertaken by Greencap in September 2019 to assess the nature and broader extent of contamination associated with pesticides residue and ACM identified in fill material across the Site.

To further facilitate the environmental audit report for the Site, in February 2020 Agon Environmental Pty Ltd (Agon) conducted further investigations and remediation works at the Site to address previously identified asbestos and pesticide-related contamination.

A detailed review of these reports has been undertaken by SLR and summaries of these are provided in the sections below.

2.3.1 Limited Soil Investigation (July 2019, Greencap)

Greencap conducted a Limited Soil Investigation (ref. J163245, July 2019) at the Site to understand the presence of pesticides beneath the building block located in the north-west corner of the Project Area (Lot A) and ACM in the fill material across the Project Area. The soil samples collected near surface were analysed for organochlorine pesticides (OCP) and heavy metals, and samples collected at depth (maximum depth of one meter below ground level (mbgl)) were analysed for the presence/absence of ACM. OCP were identified at seven of the eight near surface soil sampling locations and comprised of chlordane, aldrin, dieldrin and heptachlor epoxide. Concentrations of aldrin and dieldrin exceeded the nominated health-based IL for residential land use at three of the sample locations.

SLR understands that this investigation was limited in its scope and as such the sampling program undertaken did not provide a comprehensive understanding of the extent and nature of asbestos contamination across the Project Area. However, the investigation did identify that fill material was present across the Project Area to a maximum depth of 0.8 mbgl. The investigation did not assess the other areas of the Project Area where building blocks were once present for OCP and arsenic based compounds.

Sample locations conducted in this investigation that relate directly to soil conditions within Lots B1, B2 and B3 are summarised below.

- Testpit locations TP01, TP02, TP03, TP04 and TP05, samples collected at depths ranging from 0.0-0.1 to 0.3-0.4 m bgl.

ACM fragments were reported in samples TP02_0.1-0.2 and TP04_0.2-0.3. The areas where these soil samples were collected from have since been excavated and, screened and validated as part of the subsequent remediation works conducted at the Site.

The clearance certificate for lots B1, B2 and B3 is provided as **Appendix C** and validation analytical results are presented in **Appendix G**.

None of the surface soil samples analysed for OCPs and heavy metals during this investigation were collected from Lots B1, B2 and B3.

2.3.2 Detailed Soil Investigation (September 2019, Greencap)

Greencap conducted a DSI (ref. J163803) to further evaluate the extent of termite control pesticides in near surface soils and the extent of potential asbestos impact within the fill material identified across the Project Area. Near surface samples collected from or adjacent to the footprint of 11 residential building blocks were analysed for OCP and heavy metals. Deeper soil samples collected to a maximum depth of 1 mbgl across the Project Area were analysed for the presence/absence of asbestos where suspected, based on visual observations. The OCP concentrations were reported above the laboratory's detection levels in the majority of near surface soil samples with results exceeding the adopted health-based IL from two of the building footprints of the Site. Bonded asbestos was detected at six sampling locations and friable asbestos was detected at one sampling location.

Sample locations conducted in this investigation that relate directly to soil conditions within Lots B1, B2 and B3 are summarised below.

- Surface soil samples: SS 17 – SS 44, samples collected at depths ranging from 0.0 – 0.1 mbgl, that were collected to assess potential pesticide and heavy metal impact.

- Testpits: TP10, TP11, TP13, TP14, TP16, TP17, TP18, TP19, TP21, TP22, TP24, TP25, TP27, and TP28, where testpit samples were collected at various depths ranging from 0.00-0.05 to 0.00 – 0.8 mbgl.

Fragments of possible ACM were only detected in the bulk sampling and sieving of TP11 (0.00-0.8 mbgl) and TP17 (0.00-0.4 mbgl). The calculated bonded asbestos in soil concentration (calculated in general accordance with ASC NEPM 2013) for the following samples were compared to the adopted human health-based IL for residential land use (0.01 w/w%).

- TP11 (0.00-0.8 mbgl) – 0.0014 w/w%, which is below the nominated IL.
- TP17 (0.00-0.4 mbgl) – 0.0.156 w/w%, which exceeds the nominated IL.

None of the samples collected from the Site and submitted for AF/FA analysis detected asbestos above the laboratory's limit of reporting.

Pesticide impact above the adopted human-health based IL for residential land use was only detected in surface soil samples SS18 (heptachlor – 7.8 mg/kg) and SS30 (aldrin + dieldrin – 368.8 mg/kg). Heavy metal impact was not detected above the nominated ILs.

The areas of the Site where samples reported impact above the nominated human health based ILs, have since been excavated, screened and validated as part of the subsequent remediation works conducted at the Site.

The clearance certificate for lots B1, B2 and B3 is provided as **Appendix C** and validation analytical results are presented in **Appendix G**.

2.3.3 Additional Soil Investigation (October 2019; Greencap)

Greencap conducted an Additional Soil Investigation (ref J163803-02) to:

- address data gaps in previous investigations undertaken within the Project Area
- delineate the extent and nature of asbestos impact found within the fill material
- delineate the extent of OCP identified within the former building footprints and immediate surroundings.

OCP were detected under most building footprints across the Project Area. Many forms of bonded ACM fragments were identified across the Project Area and were associated with the layers of fill. It was also observed that ACM fragments were scattered sporadically across the surface of the Project Area possibly due to historical demolition works. Friable asbestos was also identified at several locations and concentrations detected exceeded the adopted health-based criteria.

Sample locations assessed in this investigation that related directly to the soil conditions within Lots B1, B2 and B3 are summarised below.

- Surface soil samples: SS56, SS57, SS58, SS59, SS60, SS61, SS62, SS63, SS68 (used to delineate impact previously detected at SS18), SS69 (used to delineate impact previously impact detected at SS30), with samples collected at depths ranging from 0.0 to 0.5 mbgl.
- Testpits: TP36, TP37, TP38, TP39, TP40, TP41, TP42, TP43, TP44, TP45, TP46, TP47, TP48, TP49, TP51, TP56 and TP57, with samples collected from various depths ranging from 0.0 – 0.05 mbgl to 0.6 – 0.7 mbgl.

Asbestos impact was detected in the following testpit samples.

- TP38 (0.00-0.1 mbgl) – AF/FA in soil 0.0012 w/w%, which is above the nominated IL (0.001 w/w%).
- TP39 (0.0-0.1 mbgl) – AF/FA in soil 0.01 w/w%, which is above the nominated IL (0.001 w/w%).
- TP40 (0.0-0.1 mbgl) – bonded ACM in soil 0.017 w/w%, which is above the nominated IL (0.01 w/w%).
- TP42 (0.3-0.4 mbgl) – bonded ACM in soil 0.235 w/w%, which is above the nominated IL (0.01 w/w%).
- TP42 (0.6 – 0.7 mbgl) – bonded ACM in soil 0.011 w/w% (above the nominated IL) and AF/FA in soil 0.0064 w/w% (above the nominated IL).
- TP43 (0.0 -0.1 mbgl) – bonded ACM in soil 0.003 w/w%, which is below the nominated IL (0.01 w/w%).
- TP45 (0.1-0.2 mbgl) – bonded ACM in soil 0.012 w/w%, which is above the nominated IL (0.01 w/w%).
- TP51 (0.0-0.05 mbgl) – AF/FA in soil 0.00002 w/w%, which is below the nominated IL (0.001 w/w%).

In addition to the soil samples collected from the testpits, two samples of possible ACM debris were collected from the surface of the Site (FCS01 and FCS02) and were confirmed to contain asbestos.

Pesticide impact above the adopted human-health based IL for residential land use was only detected in surface soil sample SS69_S(5)_0.0 (aldrin + dieldrin – 23.4 mg/kg).

The areas of the Site where samples reported impact above the nominated human health based ILs for residential landuses, have since been excavated, screened and validated as part of the subsequent remediation works conducted at the Site.

The clearance certificate for lots B1, B2 and B3 is provided as **Appendix C** and validation analytical results are presented in **Appendix G**.

2.3.4 Detailed Site Investigation (February 2020; Agon)

Agon conducted a risk based DSI followed by remediation work within the Project Area. The investigation process was assessed by the Auditor to confirm if the Project Area is suitable for the proposed future development. The DSI included the investigation of asbestos, pesticides and groundwater to characterise the environmental condition of the Project Area. The findings were consistent with the previous investigations with fill material being encountered evenly across the Project Area.

Sample locations assessed in the Agon investigation that relate directly to soil and groundwater conditions within residential allotments Lots B1, B2 and B3 are summarised below.

- Testpits: TP09 (0.1 mbgl, 0.7 mbgl), TP011 (0.2 mbgl, 0.8 mbgl), TP13 (0.1 mbgl, 0.6 mbgl), TP14 (0.1 mbgl, 0.6 mbgl), TP16 (0.1 mbgl, 1.0 mbgl), TP17 (0.2 mbgl), TP18 (0.1 mbgl, 1.0 mbgl), TP19 (0.1 mbgl, 0.7 mbgl), TP20 (0.1 mbgl, 0.8 mbgl).
- Soil samples collected when installing monitoring wells MW02 (4 mbgl, 5 mbgl) and MW03 (4 mbgl, 5 mbgl).
- Groundwater samples collected from monitoring wells MW02 and MW03.

Visible evidence of ACM was not detected in any of the testpits advanced across the Site during this investigation. Pesticide impact above the adopted human-health based IL for residential land uses was detected in soil sample TP9_0_0.1 (aldrin+dieldrin – 7.5 mg/kg). Nickel was detected in one sample (TP19_0_0.1 - 16 mg/kg) at a concentration above the environmental based IL specified for an urban residential and public open space setting but it did not exceed the adopted human health-based IL for residential land uses.

Minor concentrations of chloroform and TRH fractions were reported in the groundwater samples collected during this investigation. However, silica gel clean-up was conducted on the highest results which reduced the TRH results to below the laboratory's limit of reporting (LOR). Groundwater samples collected from monitoring wells installed across the Project Area reported analytes' concentrations either below the laboratory's LOR or below the adopted assessment criteria. Some heavy metals exceeded the adopted assessment criteria in the groundwater samples collected, however they are not considered to pose a risk to future commercial users of Lot A as access to groundwater is considered unlikely.

During this investigation, Agon oversaw the removal of surface soils that reported pesticide concentrations above the nominated health-based ILs for residential land uses (but below the health-based ILs specified for commercial/industrial land uses) from the wider Project Area. Soil from these "hotspot" areas were removed and relocated onto Lot A (proposed police station). According to the Agon report, the following "hotspots" were remediated that relate specifically to Lots B1, B2 and B3.

- SS18 (heptachlor) (Greencap).
- SS30 (aldrin+dieldrin) (Greencap).
- SS69_S (aldrin+dieldrin) (Greencap).
- TP09_0_0.1 (aldrin+dieldrin) (Agon DSI).

Remediation works involved the removal of fill material from a 5 m^2 area around each "hotspot" location to a depth of 5 mbgl. The excavated soils were relocated to Lot A (proposed police station). Approximately 35 m^3 of soil was moved from the Site (i.e. Lots B1, B2 and B3) to the commercial area of the Project Area (i.e. Lot A).

As part of the Agon's investigation and remediation works, ACM, soil containing bonded ACM and soils containing AF/FA concentrations that exceeded the adopted criteria for residential land use, were remediated and resultant excavations visually validated. According the Agon report, the following "hot spots" that were remediated that relate specifically to Lots B1, B2 and B3 are listed below.

- TP38 (0.00-0.1 mbgl).
- TP39 (0.00-0.1 mbgl).

Remediation works involved the removal of fill material from a 5 m^2 area around each of the "hotspot" locations. The depth of the excavation extended down into natural soils. Where asbestos material was encountered, the ACM material was placed into double sealed bags for appropriate offsite disposal by the licenced asbestos removal contractor. The resultant excavated area was visually inspected by an Agon representative (Agon, 2020).

Although ACM was also previously detected in testpit samples TP17 (0.0-0.4 mbgl), TP40 (0.0-0.1 mbgl), TP42 (0.3-0.4 mbgl and 0.6-0.7 mbgl), TP43 (0.0-0.1 mbgl), TP45 (0.0-0.2 mbgl) and TP51 (0.0-0.05 mbgl) these locations were not targeted for further remediation works during the remediation works conducted by Agon. However, given that the subsequent remediation works presented in this report involved the removal of fill material across the Site (i.e. Lots B1, B2 and B3) and removal of abandoned underground services, including those constructed out of ACM, SLR considers that these previously identified "hotspot" locations have been excavated, screened and validated as part of the remediation works undertaken by SLR (and subsequently presented herein).

The clearance certificate for lots B1, B2 and B3 is provided as **Appendix C** and validation analytical results are presented in **Appendix G**.

2.3.5 Detailed Site Investigation (August 2020, SLR)

SLR completed a DSI within the Road Reserve and Lot C (SLR report *680.10679-R03-v1.0 DSI – Road Reserve and Lot C*). The findings of this investigation as it pertains to the Site is summarised below.

- Asbestos impacted soils were identified along the boundary between the Road Reserve and western boundary of proposed Lots B2 and B3. Evidence of asbestos was visually identified in seven test pits. Laboratory testing confirmed that bonded ACM and soils containing AF/FA were present above the adopted criteria. Lateral delineation of the impact found on the western boundary of proposed Lots B2 and B3 had not been achieved during the DSI, and it was suspected that it would extend into a portion of Lots B2 and B3.
- Chemical analysis of soils indicated that, aside from the asbestos impacted areas, the material within the remainder of the Site was considered low risk and excess spoil could be disposed of as General Solid Waste (non-putrescible) with reference to the NSW Waste Classification Guidelines 2014b.
- Abandoned services were encountered in many locations across the Site including irrigation, conduit (assumed to be electrical), Polyvinyl Chloride (PVC) pipe (assumed to be sewerage), and concrete (assumed to be stormwater) lines.
- Reworked fill material was encountered across the Road Reserve and Lot C area of investigation. Apparent natural ground was intersected in 37 of the 40 test pits within which the average depth of fill was 0.53mbgl (ranging from 0.2–1.3mbgl). Further to the asbestos related impacts detailed above, additional anthropogenic waste was found in some test pits and appeared to be primarily related to old sub-surface infrastructure or construction demolition works including concrete, plastic conduit, and bricks.

None of the testpits completed during this investigation were collected from residential allotments Lots B1, B2 and B3.

2.4 Source of Asbestos Impact – Site

In summary, based on the results from previous investigations and observations noted during remediation works conducted across the Site, identified asbestos impact appears to have resulted from a number of sources as described below.

- Asbestos impact identified within the uncontrolled fill material present across the Project Area (including the Site), appears to be residential building debris (mainly fragments of ACM sheeting). The presence of asbestos debris within surface soils is a common feature in Darwin due to the widespread damage caused by Cyclone Tracy in December 1974. The 1975 aerial imagery covering the Project Area, clearly shows the presence of scattered debris post Cyclone Tracy.
- Sheeting made from ACM appeared to be used as forming during the installation/construction of some of the concrete stormwater risers encountered along the boundaries between the Road Reserve, and Residential Lot B2 and Lot B3. ACM debris was also identified in the rework material around these stormwater risers.
- Asbestos impacted fill material was also identified between layers of asphalt found in the Road Reserve, which suggests that fill material impacted with asbestos debris had been used to construct (or upgrade) the road system within the Project Area.
- Pipes made from ACM products were used for the Project Area's water distribution system and in some instances used as a conduit for communications cables, and as such, are considered additional primary source of asbestos impact. Asbestos pipes were found in the middle (Road Reserve) to the southern portion of the Project Area (Residential Lot B2).

3 Remediation and Validation Methodology

3.1 Remediation Strategy and Deviations

Remediation and validation activities conducted at the Site were completed in general accordance with the remediation strategy (SLR ref: 680.10679.00000-M04-v2.0 20200603) endorsed by the Auditor and included in **Appendix B**.

The remediation strategy was developed in general accordance with the following guidelines and standards.

- National Environment Protection Council (1999, 2013 revision), National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM).
- Australian Standard AS 4482.1-2005, "Guide to the Sampling and Investigation of Potentially Contaminated Soil. Part 1: Non-volatile and semi-volatile compounds".
- WA DoH 2019, "Guidelines for the Assessment, Remediation and Management of Asbestos Contaminated Sites in Western Australia, Consultation Draft", November 2019.
- NT EPA 2017, "Northern Territory Contaminated Land Guidelines".

In addition, SLR's Standard Operating Procedures (SOPs) were followed to ensure integrity was maintained and sampling procedures were completed in general accordance with the relevant guidelines and standards.

In essence, the remediation and validation activities that were carried out at each of the residential allotments included the following.

- Stripping and excavating uncontrolled fill materials to apparent natural soil conditions (either weathered rock or rock) across the Site. Visually inspecting the spoil and resultant excavations during the stripping and excavations works for evidence of ACM or other COPCs. Based on visual observations, progressively segregating the potentially impacted spoil to be stockpiled separately from non-impacted spoil.

- Removal of all known or encountered abandoned underground services (including the fill material surrounding them) that were present within the Site. Visually inspecting the services, spoil and resultant excavations during the removal works for evidence of ACM or other COPC. Progressively segregating, based on visual observations, potentially impacted spoil and services constructed out of ACM products to be stockpiled separately from non-impacted spoil.
- Visually inspecting the surfaces of, and collecting validation samples from, the remediated areas of the Site (i.e., resultant excavations/trenches). Collecting details of the areas remediated at the Site including extent and depth of excavations, validation sample locations, sample identification numbers, date sampled and photographic logs. Validation samples were collected and analysed by a NATA accredited laboratory in accordance with the methodology outlined in **Section 3.2.**
- Screening geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble from the stockpiled spoil. Visually inspecting the spoil throughout the screening process for visual evidence of ACM. Placing the screened spoil into smaller stockpiles to facilitate characterisation sampling to inform if the spoil is suitable for beneficial reuse onsite or requires offsite disposal. Spoil samples were collected and analysed in accordance with the methodology outlined in **Section 3.2.**
- Developing and maintaining a tracking log for stockpiles generated during the remediation works. Details collected included stockpile identification numbers, the origin of the material, description based on visual assessment, stockpile locations, locations of all characterisation samples, stockpile volumes, dates of sampling, future segregation (if required based on analytical results) and final destination being either offsite disposal or onsite reuse.
- Engaging a licenced asbestos removal company for the appropriate offsite disposal of services made from ACM, ACM debris and asbestos impacted soil. Visually inspecting and collecting validation samples of the surface areas where asbestos impacted material was stockpiled to confirm that all ACM was adequately removed.
- Comparing analytical results obtained for soil samples collected at the Site with relevant ILs. Where validation samples returned results above the ILs, undertaking further excavation and validation sampling to ensure the Site's remediation objectives were achieved.
- Overseeing the reinstatement of excavated areas with spoil material characterised as being suitable for reuse on Site, in approximately 200mm thick lifts. Visually inspecting each lift for the purpose of providing ACM clearance certificates.
- Undertaking air quality monitoring to determine the presence of air borne asbestos fibres during all remediation and validation works undertaken at the Site.
- Collating all field notes, photographic logs, certified laboratory reports, soil movement logs, asbestos clearance certificates, waste disposal document and air quality monitoring results.
- Preparing a validation report document all remediation and validation works undertaken at the Site.

3.2 Soil Sampling Methodology

Soil validation and characterisation sampling were undertaken in accordance with the remediation strategy, the details of which are provided in **Table 4**.

Table 4 Soil sampling methodology

Activity	Comment / Details
Soil sampling frequencies	• Spoil characterisation samples were collected from the excavated, stockpiled material at a frequency of one sample every 70 m^3 with a minimum of three samples per stockpile material. Asbestos samples were sieved and analysed in accordance with WA DOH guidelines for stockpiled material. • Validation samples were collected from the base of each excavation at a minimum rate of one sample per 25 m^2 of excavation base, with a minimum of one sample collected from each excavation base. Given the low risk of ACM within natural materials, asbestos analysis of validation samples only included presence/absence. • Co-ordinates of sample locations were recorded using a handheld GPS device.
Field quality control sampling	• Duplicate samples were collected at a rate of 1:20 for soil samples. • One equipment rinsate blank (taken from re-usable equipment) collected for each day of sampling and analysed for COPC.
Sample collection	• Samples were collected in general accordance with AS4482.1-2005 and SLR SOPs. Dedicated disposable nitrile gloves and laboratory supplied sample containers were used for sample collection.
Sample preservation	• Samples were placed in laboratory supplied jars and stored as close to 4°C as practicable, in insulated chilled containers while onsite and in transit to the laboratory.
Sample submission	• Chain of custody (COC) documentation were completed at the time of sample collection and submitted with the samples to the nominated laboratory. • All samples were submitted to a NATA accredited laboratory for analysis. • 50% of spoil characterisation samples were submitted for analysis, with the rest held by the laboratory for further analysis if required should substantial[#1] variability in analytical results required further statistical assessment. • 50% of validation samples were submitted for analysis, with the rest held by the laboratory for further analysis if required should substantial variability in analytical results required further statistical assessment. In the event a validation sample recorded asbestos impact, samples collected in the near vicinity of the validation sample were analysed to determine the extent of the residual impact.

#1 substantial variability will be assessed via a coefficient of variation (CV) assessment as per the NSW EPA Sampling Design Guidelines (1995) with stockpiles with a CV value >1 considered to have substantial variability.

3.3 Decontamination of Equipment

A 20-ton excavator was used to remove contaminated asbestos soil, fill material and abandoned underground services in Lots B1, B2 and B3. The excavator was solely used for the earthworks of the Site and decontamination procedures were followed. The excavator bucket was washed within asbestos stockpile footprints area and the ground surface was visually inspected and validation samples collected to assess the contamination from the excavator.

3.4 Analytical Assessment

Spoil characterisation and validation samples were submitted to laboratories NATA accredited for the analyses performed, and included:

- ALS Pty Ltd (ALS) – for analyses of all COPCs
- Eurofins Environment Testing Australia Pty Ltd (Eurofins) - for analyses of all COPCs
- Greencap Pty Ltd (Greencap) – asbestos analysis only.

Scheduled soil samples were analysed for:

- Soil characterisation as per the ASC NEPM
- Total recoverable Hydrocarbons (TRH) and Total Petroleum Hydrocarbon (TPH)
- Polynuclear Aromatic Hydrocarbon (PAH)
- Benzene, toluene, ethylbenzene and xylene (BTEX)
- Organochlorine Pesticides (OCPs) and organophosphorus pesticides (OPPs)
- Asbestos (WA DoH/NEPM samples)
- Asbestos (presence/absence)
- Priority metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, and zinc).

All non-scheduled samples were placed on hold at the laboratory should further analysis be required as part of the characterisation and validation process.

The DSI previously undertaken by SLR (SLR DSI 2020) confirmed that asbestos impact, when identified, appeared to be confined to the fill material overlaying the natural deeper red silty clay soil material. As the excavations extended down into the natural red soil material, it was agreed with the Auditor when developing the remediation strategy, that the base of the excavations would be visually assessed and soil samples collected from the base analysed for presence/absence only, to verify whether asbestos impact had been adequately removed.

3.5 Screening Criteria

The following criteria were used to assess the potential risk posed to current and future users of the Site and sites at which spoil materials could be reused. The nominated screening criteria were selected from the following guidelines:

ASC NEPM:

- Health based Investigation Levels (HILs) for Residential B sites
- Soil Health Screening Levels (HSL) for vapour intrusion – Residential B sites
- Ecological Investigation Levels (EIL) for Urban Residential, Parks and Open Space (URPOS) sites
- Ecological Screening Levels (ESL) for URPOS sites
- Management limits for TPH fractions in soil – URPOS sites.

WA DOH:

- Soil Asbestos Screening Criteria for AF/FA, all site uses
- Soil Asbestos Screening Criteria for ACM -residential sites
- For clarity, screening criteria for asbestos will be high density residential (Residential B) as per Table 7 of the NEPM (ASC) 2013 Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater.

3.6 Air monitoring

Air monitoring was conducted for the duration of the stripping, stockpiling and characterisation works as a precautionary measure. The airborne asbestos monitoring was conducted at the boundaries of the Site (north, south, east and west) and were static locations.

Monitors were setup at the commencement of the shift (approximately 0700) and collected at the completion of Site works (ranges from 1600 – 1700 on weekday and from 12 noon -1300 on Saturday).

Each monitor was calibrated as per SLR's internal NATA accredited procedure and set at a flow rate of 1 L/minute Monday to Friday and 2 L/min on Saturday (as the work shift is shorter, 0700 – 1300, so the flow rate is increased to ensure an appropriate sampling volume is achieved over the shorter shift).

SLR is NATA accredited in our Darwin laboratory to conduct all sampling and analysis of filters. SLR's accreditation number is 3130**.** Air monitoring was conducted in accordance with the Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Dust, 2nd Edition [NOHSC: 3003 (2005)].

All air monitoring results were compared to the public health exposure standard of 0.01 fibres/mL.

Consideration was given to the asbestos air-quality limit of 0.01 fibres/mL, for protecting the public around contaminated sites as endorsed by the enHealth Council in Management of asbestos in the non-occupational environment 2005 document (enHealth 2005).

In the event results of the airborne asbestos monitoring showed respirable asbestos fibre levels in excess of the levels outlined in **Table 5** action was taken immediately.

Table 5 Air Monitoring Action Levels

Action Level	Control	Action
Less than 0.01 fibres/mL	No new control measures are necessary	• Continue with current measures.
At 0.01 fibres/mL or more than 0.01 fibres/mL but less than or equal to 0.02 fibres/mL	1. Review	• Review control measures.
	2. Investigate	• Investigate the cause.
	3. Implement	• Implement additional or alternative controls to eliminate or minimise exposure and prevent further releases. • Communicate any additional controls during daily pre-start meeting.
More than 0.02 fibres/mL	1. Stop removal works	• Cease excavation/transport of material.
	2. Notify Regulator	• Notify the Head Contractor, followed by the regulator (NT WorkSafe) both verbally and in written communication.
	3. Investigate the cause	• Conduct a thorough assessment across the Site to determine the cause. • Consult with all personal involved in the works. • Determine ongoing mitigation measures. • Continue to carry out air-monitoring to ensure further controls have mitigated the problem.

Table adopted form the Code of Practice under Section 274 of *the Work Health and Safety (National Uniform Legislation) Act 2011 (the WHS Act): How to safely remove Asbestos*

4 Results

The remediation and validation activities undertaken in Lots B1, B2 and B3 were completed between 20 July and 28 September 2020.

Civil works were completed in general accordance with the Principal contractor's (Greenspace Pty Ltd) Construction Environmental Management Plan (CEMP) T20-1056_V2.0. THE Mining Pty Ltd was engaged by the Principal Contractor to undertake earthworks across the Site. Earthworks were required to remove uncontrolled fill material identified across the Site including ACM, abandoned underground services, and screening and segregation of excavated spoil stockpiles originating from Lots B1, B2 and B3. Northern Trade Solutions Pty Ltd (NTS) were engaged to appropriately remove and dispose of ACM products and asbestos impacted soils. NTS holds a Class A Licence in asbestos removal and demolition.

Field observations and summaries of the analytical results obtained for the remediation and validation activities undertaken within each of the residential allotments are provided below.

4.1 Remediation and Validation of Lot B1

A photographic log of the remediation work is provided in **Appendix D**. The extent of the excavation works conducted in Lot B1 is shown in **Figure 3 (Appendix A)**.

4.1.1 Field observations

Key field observations noted during the remediation work are summarised below.

- Vegetation (grass/weeds) and tree roots were noted across the surface of the allotment. This material was removed and stockpiled on Lot B3.
- Subsurface soil profile encountered across Lot B1 was typically fill material comprising of greyish to light brown sandy silt and fine sandy gravelly silt at depths varying from 0.4 mbgl to a maximum of 1.8 mbgl.
- The maximum depth of the excavation was 2.0 mbgl.
- The concrete footings from Lot B1 were removed and loaded directly onto trucks and stockpiled at locations on the adjacent Lot B2 and the Road Reserve. Any ACM observed within the crushed concrete layer noted across the Site was also segregated and placed within the designated asbestos waste stockpile (STP5).
- The surface soils (fill material) across Lot B1 were excavated to apparent natural soil conditions. Spoil from the excavation was inspected for asbestos contamination and segregated where required. Spoil was loaded directly onto trucks and stockpiled at designated locations in the adjacent Lot B3 and the Road Reserve for further screening and characterisation.
- Numerous ACM fragments were found during the stripping of fill material from Lot B1. ACM fragments and soils impacted with ACM were segregated and stockpiled within a designated area for offsite disposal as asbestos waste (STP5). The designated asbestos waste stockpile was located on a sealed surface within the Road Reserve and was lined with geofabric to prevent cross contamination to the ground surface. The asbestos waste stockpile was deliberately positioned above an area that had already been confirmed as being impacted with asbestos and was earmarked for future remediation works as detailed in the Lot C and Road Reserve remediation strategy (SLR reference: 680.10679-R04-v5.0).
- The majority of spoil from Lot B1 was stockpiled at designated locations on the Road Reserve and Lot B3. The stockpiles were screened to remove geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble.
- Several abandoned underground services including, stormwater, sewer pipes, water distribution pipes, electrical and communications cables were removed from Lot B1. Any ACM fragments and soils impacted with ACM were segregated and stockpiled at the designated asbestos waste stockpile (STP5). Upon underground services removal, the resultant trenches were visually inspected for evidence of any residual ACM.
- No stained or odorous soils were encountered across the allotment during earthworks.
- Excavated areas within Lot B1 were reinstated with screened spoil characterised as being suitable for Site reuse. The surface of each 200mm lift of reinstated material was visually inspected for the presence of any ACM. Asbestos clearance certificates are provided in **Appendix C**.

4.1.2 Summary of Analytical Results

A tabulated summary of the analytical laboratory results is included in **Appendix G** and certified laboratory certificates are provided in **Appendix H**.

A summary of the validation samples collected for Lot B1 is provided in **Table 6**. Sample locations are shown on **Figure 3 (Appendix A)**. A summary of analytical results is as follows.

- A total of 82 validation samples were collected from the excavation base on Lot B1. Of the samples collected, 41 samples were submitted for laboratory analysis. All samples that were submitted for laboratory analysis reported concentrations of COPC below the nominated ILs except for sample V64, which detected chrysotile asbestos.
- Further excavation was undertaken around sample location V64, which resulted in extending the depth of the excavation 0.3 m into the natural reworked soils within an approximate area of 30 m^2 around the "hot spot". Three additional validation samples were collected from the resultant excavation (Val49B, Val64B and Val65B). Asbestos was not detected in the additional samples collected.
- Eleven samples were collected from the walls/bases of excavations resulting from the removal of underground services. Of these samples, five were submitted for laboratory analyses. All samples that were submitted for laboratory analysis reported concentrations below the nominated ILs.
- Concentrations of OCPs were detected in a number of validation samples submitted for analyses. The concentrations detected were below the nominated ILs. Compounds detected included aldrin and dieldrin and to a lesser extent chlordane and heptachlor.
- Metals were detected in all validation samples submitted for analyses. The concentrations detected were below the nominated IL. Metals detected included arsenic, lead, total chromium (III+IV), copper, nickel and zinc.
- Hydrocarbons (TPH/TRH), BTEXN and PAH compounds were not detected in any of the samples submitted for laboratory analyses.

Table 6 Validation and Characterisation Samples in Lot B1

Sample Type	Sample Identification	Analysis
Characterisation sample	CHAR-VAL – Sample was collected at validation sampling location V50	*Characterisation as per the ASC NEPM
Characterisation samples	V30, V60 and V80	Leachable metals (arsenic and chromium)
Base validation samples	V02, V04, V06, V08, V10, V12, V14, V16, V18, V20, V22, V24, V26, V28, V30, V32, V34, V36, V38, V40, V42, V44, V46, V48, V50, V52, V54, V56, V58, V60, V62, V64, V66, V68, V70, V72, V74, V76, V78, V80, V82	*Presence/absence of asbestos in soils *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals

Field QC samples – equipment rinsate blanks	RINSATE (23-07-2020)	*TPH/TRH *PAHs *BTEXN *OCP/OPP *metals (filtered)
Surface samples collected beneath areas where asbestos waste stockpiles were stored		

4.1.3 Clearance Inspections

Visual inspections were conducted after each lift of spoil during the reinstatement of the excavations. No visual evidence of asbestos was identified on the surface of any of the lifts. The visual clearance certificate is included in **Appendix C**.

4.2 Remediation and Validation of Lot B2

A photographic log of the remediation work is provided in **Appendix E**. The extent of the excavation works conducted in Lot B2 is shown in **Figure 4 (Appendix A)**.

4.2.1 Field observations

Key field observations noted during the remediation work are summarised below.

- Vegetation (grass/weeds) and tree roots were noted across the surface of the allotment. This material was removed and stockpiled on Lot B3.
- Subsurface soil profile encountered in Lot B2 was similar to Lot B1 and comprised of greyish to light brown sandy silt and fine gravelly silt at depths varying from 0.4 mbgl to a maximum of 1.8 mbgl.
- The maximum depth of the excavation was 2.0 mbgl.
- The concrete footings from Lot B2 were removed and loaded directly onto trucks and stockpiled at locations on the adjacent Lot B3 and the Road Reserve. Any ACM observed within the crushed concrete layer was segregated and placed within the designated asbestos waste stockpile (STP5).

- The surface soils (fill material) across Lot B2 were excavated to apparent natural soil conditions. Spoil from the excavation was inspected for asbestos contamination and segregated where required. Spoil was loaded directly onto trucks and stockpiled at designated locations in the adjacent Lot B3 and the Road Reserve for further screening and characterisation.
- ACM fragments and soils impacted with ACM were segregated and stockpiled within a designated area for offsite disposal as asbestos waste (STP5).
- Numerous ACM fragments were found during the stripping of fill material from Lot B2. The condition of the ACM fragments was observed to be more degraded than those found in Lot B1. Following confirmation that fill material in Lot B2 contained ACM debris in poor condition, 11 test pits were completed across the allotment to understand whether there were any changes in composition of fill material and the likely extent of the ACM debris found to be in poor condition.
- The majority of spoil from Lot B2 was stockpiled at designated locations on the Road Reserve and Lot B3. The stockpiles were screened to remove geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble.
- Various abandoned underground services including, stormwater, sewer pipes, water distribution pipes, irrigation pipes and electrical and communication cables, were removed from Lot B2. Any ACM fragments and soils impacted with ACM were segregated and stockpiled at the designated asbestos waste stockpile.
- Two abandoned asbestos pipes were identified within Lot B2. One pipe was a former water distribution pipe (part of the fire water system) and the other was used as a conduit for communication cables. The asbestos products were in relatively good condition (i.e., bonded). They were removed and the ACM products stockpiled at the designated asbestos waste stockpile for appropriate offsite disposal.
- Upon underground services removal, the resultant trenches were visually inspected for evidence of any residual ACM.
- No stained or odorous soils were encountered across the allotment during earthworks.
- Excavated areas within Lot B2 were reinstated with screened spoil characterised as being suitable for Site reuse. The surface of each 200mm lift of reinstated material was visually inspected for the presence of any ACM. Asbestos clearance certificates are provided in **Appendix C**.
- A “live” sewer main is located along the eastern and southern boundaries of Lot B2. Remediation works within 3m of these boundaries were limited due to the presence of this “live” underground service and potential destabilisation of neighbouring fences, retaining walls and structures. Remediation works conducted in this area included topsoil stripping (to a depth of 0.3m) and targeted removal of soil where asbestos impact was visually determined (e.g. around the sewer riser).
- After topsoil stripping had occurred above the “live” sewer main, asbestos debris/fragments were visually observed in the eastern wall of the resultant excavation, within the fill layer. Where noted, the debris was removed, however further excavation to the east could not be undertaken as this would involve encroaching onto neighbouring properties.

4.2.2 Summary of Analytical Results

A tabulated summary of the analytical laboratory results is included in **Appendix G** and certified laboratory certificates are provided in **Appendix H**.

A summary of the validation samples collected for Lot B2 is provided in **Table 7**. Sample locations are shown on **Figure 4 (Appendix A)**. A summary of analytical results is as follows.

- A total of 133 validation samples were collected from the excavation base on Lot B2. Of the samples collected, 66 samples were submitted for laboratory analyses. All samples that were submitted for laboratory analysis reported concentrations of COPC below the nominated ILs except for samples V84, V174 and V192. Chrysotile and amosite asbestos were identified in samples V84 and V174. Only chrysotile asbestos was detected in sample V192.
  - Further excavation was undertaken around sample location V84, which resulted in extending the depth of the excavation 0.3 m into the natural reworked soils within an approximate area of 50 m^2 around the "hot spot". Two additional samples were collected from the resultant excavation (V84A and V85A). No asbestos was detected in the additional samples collected.
  - Further excavation was undertaken around sample location V174, which resulted in extending the depth of the excavation 0.3 m into the natural reworked soils within an approximate area of 90 m^2 around the "hot spot". Four additional samples were collected from the resultant excavation (V161A, V173A, V174A, V175A). No asbestos was detected in the additional samples collected.
  - Further excavation was undertaken around sample location V192, which resulted in extending the depth of the excavation 0.3 m into the natural reworked soils within an approximate area of 25 m^2 around the "hotspot". One additional sample was collected from the resultant excavation (V192a). Asbestos was not detected in the additional sample collected.
- A total of 64 samples were collected from the walls/bases of excavations resulting from the removal of underground services. Of the samples collected, 60 were submitted for laboratory analyses. All samples that were submitted for laboratory analysis reported concentrations of COPC below the nominated ILs except for sample Val-T-27, which reported chrysotile asbestos. Further excavation was undertaken around this sample location (depth extended 0.3 m across a 25m^2 area) and an additional sample was collected from the resultant excavation (Val-T-27a). Asbestos was not detected in the additional sample collected.
- Concentrations of OCPs were detected in a number of validation samples submitted for analyses. The concentrations detected are below the nominated ILs. Compounds detected included aldrin, dieldrin and chlordane and to a lesser extent heptachlor.
- Metals were detected in all validation samples submitted for analyses. The concentrations detected are below the nominated ILs. Metals detected included arsenic, lead, total chromium (III+IV), copper, nickel and zinc.
- Hydrocarbons (TPH/TRH), BTEXN and PAH compounds were not detected in any of the samples submitted for laboratory analyses.

Figure 4 also shows the locations of a number of surface samples (VS01 – VS08) that were collected beneath areas where asbestos waste stockpiles were stored. These samples were collected for the purpose of demonstrating that all stockpiles containing asbestos were adequately removed from the Site. Further discussion on these samples is provided in **Section 4.4.1**.

4.2.3 Clearance Inspections

Visual inspections were conducted after each lift of spoil during the reinstatement of the excavations. No visual evidence of asbestos was identified on the surface of any of the lifts. The visual clearance certificate is included in **Appendix C**.

4.3 Remediation and Validation of Lot B3

A photographic log of the remediation work is provided in **Appendix F**. The extent of the excavation works conducted in Lot B3 is shown in **Figure 5 (Appendix A)**.

4.3.1 Field observations

Key field observations noted during the remediation work are summarised below.

- Vegetation (grass/weeds) and tree roots were noted across the surface of the allotment. This material was removed and stockpiled on Lot B3.
- Subsurface soil profile encountered in Lot B3 was similar to Lots B1 and B2 and comprised of greyish to light brown sandy silt and fine gravelly silt at depths varying from 0.4 mbgl to a maximum of 1.8 mbgl.
- The maximum depth of the excavation was 2.0 mbgl.
- The concrete footings from Lot B3 were removed and loaded directly onto trucks and stockpiled on the Road Reserve. Any ACM observed within the crushed concrete layer was segregated and placed within the designated asbestos waste stockpile (STP23).
- The surface soils (fill material) across Lot B3 were excavated to apparent natural soil conditions. Spoil from the excavation was inspected for asbestos contamination and segregated where required. Spoil was loaded directly onto trucks and stockpiled at designated locations in the adjacent Road Reserve for further screening and characterisation.
- Numerous ACM fragments were found during the stripping of fill material from Lot B3. Bonded ACM fragments/sheets were also identified at the former buildings' footings and stormwater risers. Moreover, sheeting made from ACM was used as forming during the installation/construction of the stormwater risers.

- ACM fragments and soils impacted with ACM were segregated and stockpiled within a designated area for offsite disposal as asbestos waste (STP23, STP34, STP35, STP36 and STP37). The designated asbestos waste stockpiles were located on a sealed surface within the Road Reserve and was lined with geofabric to prevent cross contamination to the ground surface. The asbestos waste stockpiles were deliberately positioned above an area that had already been confirmed as being impacted with asbestos and was earmarked for future remediation works as detailed in the Lot C and Road Reserve remediation strategy (SLR reference: 680.10679-R04-v5.0).
- The majority of spoil from Lot B3 was stockpiled at designated locations on the Road Reserve. The stockpiles were screened to remove geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble.
- Various abandoned underground services including stormwater, sewer pipes, water distribution pipes, electrical and communication cables, were removed from Lot B3. ACM fragments and soils impacted with ACM were segregated and stockpiled at designated asbestos waste stockpiles. Upon underground services removal, the resultant trenches were visually inspected for evidence of any residual ACM.
- No stained or odorous soils were encountered across the allotment during earthworks.
- Excavated areas in Lot B3 were reinstated with screened and stockpiled spoil characterised as being suitable for Site reuse. The surface of each 200mm lift of reinstated material was visually inspected for the presence of any ACM. Asbestos clearance certificates are provided in **Appendix C**.
- Asbestos impacted soil observed around the “live” sewer riser located across the south-eastern corner of Lot B3 and north-eastern corner of Lot B2, was removed. All impacted soils were loaded directly onto asbestos bin for appropriate offsite disposal.
- A “live” sewer main is located along the eastern boundary of Lot B3. Remediation works within 3m of this boundary were limited due to the presence of this underground service and potential destabilisation of fences, retaining walls and neighbouring structures. Remediation works conducted in this area included topsoil stripping (to a depth of 0.3m) and targeted removal of soil where asbestos impact was visually determined (e.g., around the sewer riser).

4.3.2 Summary of Analytical Results

A tabulated summary of the analytical laboratory results is included in **Appendix G** and certified laboratory certificates are provided in **Appendix H**.

A summary of the validation samples collected for Lot B3 is provided in **Table 8**. Sample locations are shown on **Figure 5 (Appendix A)**. A summary of analytical results is as follows.

- A total of 130 validation samples were collected from the excavation base on Lot B3. Of the samples collected, 65 samples were submitted for laboratory analyses. All samples that were submitted for laboratory analysis reported concentrations of COPC below the nominated ILs except for samples Val-94 and Val-149. Chrysotile asbestos was identified in sample Val-94, and both chrysotile and amosite asbestos were identified in sample Val-149.
    - Further excavation was undertaken around sample location Val-94 that extended the depth of the excavation 0.3 m into the natural reworked soils across an area of approximately 50 m^2. Three additional samples were collected from the resultant excavation (Val-94-1, Val-94-2, Val-94-3). No asbestos was detected in the additional samples collected.

- Further excavation was also undertaken around sample location Val-149 that extended the depth of the excavation 0.3 m into the natural reworked soils across an area of approximately 50 m^2. Three additional samples were collected from the resultant excavation (Val-149-1, Val-149-2 and Val-149-3). No asbestos was detected in the additional samples collected.

- A total of 50 samples were collected from the walls/bases of excavations resulting from the removal of underground services. All samples were submitted for laboratory analyses and reported concentrations of COPC below the nominated ILs except for sample Val-T-01. Chrysotile asbestos was identified in sample Val-T-01. Further excavation was undertaken around this sample location that extended the depth of the excavation 0.3 m into the natural reworked soils across an area of approximately 20 m^2 and an additional sample was collected from the resultant excavation (Val-T-1a). Asbestos was not detected in the additional sample collected.
- Validation samples were collected after removing the asbestos impacted soil around the "live" sewer riser and submitted for laboratory analyses. Four samples were collected from the base surface of the excavated area and one sample was collected from each wall of the excavation. Asbestos was detected in the eastern wall sample. This sample is located on the eastern boundary of the site and as such further removal works could not be undertaken as this would involve encroaching on neighbouring properties.
- Concentrations of OCPs were detected in a number of validation samples submitted for analyses. The concentrations detected are below the nominated ILs. Compounds detected included aldrin, dieldrin and chlordane.
- Metals were detected in all validation samples submitted for analyses. The concentrations detected are below the nominated ILs. Metals detected included arsenic, lead, total chromium, copper, nickel and zinc.
- Hydrocarbons (TPH/TRH), BTEXN and PAH compounds were not detected in any of the samples submitted for laboratory analyses.

4.3.3 Clearance Inspections

Visual inspections were conducted after each lift of spoil during the reinstatement of the excavations. No visual evidence of asbestos was identified on the surface of any of the lifts. The visual clearance certificate is attached in **Appendix C**.

4.4 Spoil Management

Details of the stockpiles generated and their fate are summarised in **Table 9**. Comparison of the stockpile analytical results to the nominated ILs are included in **Appendix G.** Certified laboratory certificates are included in **Appendix H**.

Table 9 Stockpile Summary

Stockpile identification	Volume m^3	Description	Characterisation samples	Analysis	Summary of Analytical Results	Final Status
STP ORG-1	80m^3	Organic waste material scrapped from Lot B1.	STP- ORG-1-1, STP-ORG-1-2, STP- ORG-1-3	*Asbestos in soils *FA/AF *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals	COPC<ILs	Shoal Bay Waste Management Facility (SBWMF) – clean fill (geotechnically unsuitable for Site reuse)
STP- ORG-2	300m^3	Organic waste material (topsoil, grass and weeds) cleared from scrapping the surface of Lots B2 and B3.	STP- ORG-2-1, STP-ORG-2-3, STP- ORG-2-3, STP- ORG-2-4, STP-ORG-2-5, STP- ORG-2-6, STP- ORG-2-7, STP-ORG-2-8, STP-ORG-2-9, STP-ORG-2-10, QC7 (field duplicate of STP-ORD2-2)	*Asbestos in soils *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals *Asbestos id in bulk material	COPC<ILs	SBWMF – clean fill (geotechnically unsuitable for Site reuse)
STP1	60m^3	Concrete rubble and soil.	STP1-1, STP1-2, STP1-3	*Asbestos in soils *FA/AF *PAHs *TPH/TRH *BTEXN *OCP/OPP *metals	COPC<ILs	Crushed and reused on Site.

Stockpile identification	Volume m^3	Description	Characterisation samples	Analysis	Summary of Analytical Results	Final Status
STP2	360m^3	Screened spoil from Lot B1.	STP2-1, STP2-2, STP2-3, STP2-4, STP2-5, STP2-6, STP2-7, STP2-8, QU1-DUP (field duplicate of STP2-4)	*Asbestos in soils *FA/AF *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals	COPC<ILs	Reused on Site.
STP3	30m^3	Screened spoil from Lot B1	STP3-1, STP3-2, STP3-3	*Asbestos in soils *FA/AF *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals	COPC<ILs	Consolidated into STP13.
STP4	90m^3	Screened spoil from Lot B1.	STP4-1, STP4-2, STP4-3	*Asbestos in soils *FA/AF *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals	*Asbestos detected in one sample (STP4-3). FA/AF w/w% = 0.005 which is above the nominated IL. *All other COPC<ILs	Consolidated into STP13.

Stockpile identification	Volume m^3	Description	Characterisation samples	Analysis	Summary of Analytical Results	Final Status
STP5	265m^3	Asbestos impacted soil and ACM waste predominately from Lot B1 and Lot B2.	STP5-1, STP5-2, STP5-3, STP5-INSO*[1]	*Asbestos in soils *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals *Asbestos id in bulk material	ACM confirmed to be chrysolite	SBWMF – "special waste – asbestos"
STP6	375m^3	Screened soil from Lot B1.	STP6-1, STP6-2, STP6-3, STP6-4 STP6-5, STP6-6, CHAR-STP	*Asbestos in soils *FA/AF *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals *Characterisation as per the ASC NEPM	COPC<ILs	Reused on Site.
STP7	450m^3	Screened spoil from Lot B1.	STP7-1, STP7-2, STP7-3, STP7-4, STP7-5, STP7-6 STP7-7, STP7-11	*Asbestos in soils *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals *Asbestos id in bulk material	Asbestos fragments confirmed in one sample (STP7-1). Additional sieve testing of the stockpile did not identify any further bonded asbestos fragments. Based on agreed stockpile validation approach with the auditor this stockpile was considered suitable for Site reuse. *AF/FA was not detected in original samples. *Chromium detected above average concentration IL. Considered to be indicative of natural soil conditions. *All other COPC<ILs	Reused on Site.

Stockpile identification	Volume m^3	Description	Characterisation samples	Analysis	Summary of Analytical Results	Final Status
STP8	60m^3	Waste material (e.g. concrete, reinforced steel, etc) generated when screening spoil from Lot B1.	STP8-1, STP8-2, STP8-3, STP8-4 , QC6 (field duplicate of STP8-1)	*Asbestos in soils *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals	*Chromium detected above average concentration IL. Considered to be indicative of natural soil conditions. *All other COPC<ILs	SBWMF – general waste (geotechnically unsuitable for Site reuse)
STP9	130m^3	Waste material (e.g. concrete, etc) generated when screening spoil from Lot B2 and Lot B3.	STP9-1, STP9-2, STP9-3, STP9-4, STP9-5	*Asbestos in soils *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals	COPC<ILs	SBWMF – general waste (geotechnically unsuitable for Site reuse)
STP10	375m^3	Screened spoil from Lot B1.	STP10-1, STP10-2, STP10-3, STP10-4, STP10-5, STP10-6, STP10-7, STP10-8, STP10-9, STP10-11, STP10-12, QC8 (field duplicate of QC10-1)	*Asbestos in soils *FA/AF *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals *Asbestos id in bulk material	*Asbestos containing fragments confirmed in original samples (STP10-3, STP10-4 and STP10-6) *Stockpile resampled however asbestos containing fragments were found in two of the additional samples (STP10-9 and STP10-10) and asbestos in soil was confirmed in STP10-9. *Chromium detected above average concentration IL. Considered to be indicative of natural soil conditions. *All other COPC<ILs.	Auditor endorsed proposal regarding the management of this stockpile (verbal confirmation received from Jean-Paul Pearce on 7 August 2020). Impacted section of STP10 (10m^3) had been removed (11 August 2020) to STP5 and resultant residual stockpile (STP10A) was created.

Stockpile identification	Volume m^3	Description	Characterisation samples	Analysis	Summary of Analytical Results	Final Status

Stockpile identification	Volume m^3	Description	Characterisation samples	Analysis	Summary of Analytical Results	Final Status
STP33	$18m^3$	Waste material (e.g. concrete, etc) generated when screening spoil from Lot B3.	STP33-1, STP33-2, STP33-3	*Asbestos in soils *FA/AF *TPH/TRH *PAHs *BTEXN *OCP/OPP *metals	*Asbestos fines detected in one sample (STP33-3) at concentrations equal to the FA/AF nominated IL. *All other COPC<ILs	SBWMF - "special waste – asbestos"
STP34	$5.12m^3$	Asbestos waste from Lot B3.	Asbestos stockpile	NA	NA	SBWMF – "special waste – asbestos"
STP35	$3.5m^3$	Asbestos waste from Lot B3.	Asbestos stockpile	NA	NA	SBWMF – "special waste – asbestos"
STP36	$13.5m^3$	Asbestos waste from Lot B3.	Asbestos stockpile	NA	NA	SBWMF – "special waste – asbestos"
STP37	$0.5m^3$	Asbestos waste from Lot B3.	Asbestos stockpile	NA	NA	SBWMF – "special waste – asbestos"

Designated asbestos waste stockpiles included STP5, STP23, STP34, STP35, STP36 and STP37. Of the stockpiles not designated as asbestos waste, only stockpiles STP10, STP15, STP16 and STP21 reported asbestos impact above the nominated IL in the first round of characterisation sampling. For each of these stockpiles, a portion of spoil was removed from the location where the sample reported asbestos impact above the nominated IL. The asbestos impacted spoil was transferred to the designated asbestos waste stockpile. The remaining stockpile volume was then resampled in its entirety to determine the presence of residual asbestos impact. For stockpiles STP10 and STP15, this process was sufficient to ensure that they were suitable for reuse on Site. For stockpiles STP16 and STP21, continued detection of asbestos impact above the IL meant that these stockpiles required offsite disposal as asbestos waste.

Concentrations of OCP were detected in all stockpiles except stockpile STP14. The concentrations detected were below the nominated ILs. Compounds detected included aldrin and dieldrin and to a lesser extent chlordane and heptachlor. Chlorpyrifos (OPP) was also detected in stockpile STP6 albeit at concentrations below the nominated IL.

Metals were detected in all stockpiles. The concentrations detected were below the nominated ILs. Metals detected included arsenic, lead, total chromium copper, nickel and zinc.

Hydrocarbons (TPH C_{29}-C_{36}) were detected in stockpile STP12, which comprised of bitumen material scraped from Lots B2 and B3. The concentrations detected were below the nominated IL. Hydrocarbons (TPH $C_{15} – C_{28}$) were detected in stockpile STP14. The source of hydrocarbon is unclear as this stockpile comprised of spoil from Lot B2. The concentrations detected are below the nominated IL. Both stockpiles STP12 and STP14 were disposed of to the Shoal Bay Waste Management Facility (SBWMF).

SBWMF disposal dockets are included in **Appendix J**.

4.4.1 Cross contamination potential

To demonstrate that all stockpiles containing asbestos were adequately removed from the Site, surface samples were collected from the areas where asbestos waste stockpiles were stored. Validation samples collected did not report any asbestos impact thereby confirming that the asbestos waste stockpiles were adequately removed from the Site and did not cross contaminate the surface where they were stored.

The details of these samples are summarised in **Table 10**. Comparison of the stockpile analytical results to the nominated ILs are included in **Appendix G.** Certified laboratory certificates are included in **Appendix H**.

Table 10 Surface samples collected beneath former asbestos waste stockpiles

Stockpile identification	Surface validation samples
STP5	VS01, VS02, VS03, VS04, VS05, VS06, VS07 and VS08. Refer to Figure 4 for sample locations.
STP21	STP21-val-01, STP21-val-02, STP21-val-03 (located within Project Area on proposed allotment referred to as ”Road Reserve”)
STP34	STP34-Val-1 (located within Project Area on proposed allotment referred to as ”Road Reserve”)
STP35	STP35-Val-1 (located within Project Area on proposed allotment referred to as ”Road Reserve”)
STP36	STP36-Val-1 (located within Project Area on proposed allotment referred to as ”Road Reserve”)
STP37	STP37-Val-1 (located within Project Area on proposed allotment referred to as ”Road Reserve”)

4.5 Air Monitoring

Air monitoring for airborne fibres was conducted for each day intrusive works were carried as part of the remediation works (20 July – 28 September 2020). Monitoring results did not report airborne fibres above the detection limit of the method used, which is 0.01 fibres/ml. Air monitoring reports are included in **Appendix I.**

4.6 Data Quality Review

4.6.1 Field Duplicate Samples

Table 11 outlines the primary and duplicate sample combinations collected and submitted for analyses during the remediation and validation work undertaken across the Site. Results are summarised in the analytical tables included in **Appendix G.** Certified laboratory certificates are included in **Appendix H**.

Table 11 Summary of QC Combinations

STP-ORG2-2	QC7
STP10-1	QC8
V90	QC9
V110	QC10
V130	QC11
V150	QC12
V170	QC13
V190	QC15
V210	QC16
STP15-1	QC17
STP24-5	QC18
VaL-159	QC19
Val-171	QC20
Val-179	QC21
Val-181	QC22
Val-185	QC23
STP32-03	QC29

Except for the analytes listed below in **Table 12**, the remaining relative percent differences (RPDs) were considered acceptable for the primary and duplicate sample combinations. For this investigation, a 50% RPD acceptance criteria has been adopted.

Table 12 Summary of RPDs exceeding the acceptable limit

Parent sample	Sample date	Duplicate	Analyte	RPD %
STP2-4	21-07-2020	QUI-DUP	Chromium (III+IV)	78%
			Zinc	56%
STP8-1	27-07-2020	QC6	Dieldrin	57%
STP10-1	28-07-2020	QC8	Zinc	100%
STP15-1	04-08-2020	QC17	Dieldrin	58%
			Chlordane	57%
V130	05-08-2020	QC10	Dieldrin	109%
V150	05-08-2020	QC12	Chromium (III+IV)	74%
			Zinc	151%
Val-171	10-09-2020	QC20	Moisture content	112%
			Chromium (III+IV)	68%
			Chlordane	117%
			Dieldrin	156%
Val-179	10-09-2020	QC21	Moisture content	68%
			Zinc	82%
			Chlordane	138%
Val-181	10-09-2020	QC22	Chromium (III+IV)	75%
Val-185	10-09-2020	QC23	Moisture content	144%
STP33-02	18-09-2020	QC29	Zinc	140%

SLR considers the elevated RPDs reported in the sample combinations listed in **Table 12** to be representative of the heterogenous nature of the soils encountered across the Site.

4.6.2 Equipment Rinsates

Table 13 lists the 18 equipment rinsate blanks that were collected and analysed for quality assurance purposes. No analytes were detected at concentrations exceeding the laboratory's limit of reporting. Certified laboratory certificates are included in **Appendix H**.

Table 13 List of equipment rinsate blanks

QC Type	Sample identification (date collected)
Equipment rinsate blanks	RINSATE (21-Jul-20) RINSATE (23-07-2020) RINSATE (27-Jul-20) RINSATE (28-Jul-20) RINSATE 4/08/2020 (4-Aug-20) RINSATE 5/08/2020 (5-Aug-20) RINSATE 6/08/2020 (6-Aug-20) RINSATE (12-Aug-2020) RIN14 (14-Aug-20) RIN17 (17-Aug-20) RINSATE (20-Aug-20) RINSATE (2-SEP-20) RB01 (8-Sep-20) RB02 (10-Sep-20) RB03 (11-Sep-20) RB04 (14-Sep-20) RB05 (14-Sep-20) RINSATE (18-SEP-20)

5 Conceptual Site Model

The Site's Conceptual Site Model (CSM) has been updated taking into account the remediation and validation works conducted at the Site (and presented in this report), as well as the results from previous environmental investigations undertaken at the Site.

The CSM prepared for the Site and its surrounds is presented in **Table 14**.

In developing the CSM, the following points were considered.

- All known asbestos impact at the Site has been remediated and resultant excavations have been validated through either soil and/or visual clearance inspections, as detailed in this report.
- Pesticide soil impact previously identified at the Site (Greencap September and October 2019) was reported to be relocated to the commercial allotment (i.e. Lot A, proposed police station) (Agon DSI 2020). Soil samples collected during the Site's remediation and validation works conducted by SLR (and presented in this report), did not report any pesticide impact above the nominated ILs specified for residential land use. As such, pesticides are no longer considered a COPC for the Site.

- Heavy metals such as arsenic, copper, lead, nickel, zinc and total chromium were detected in validation samples collected located across the Site (resulted presented in this report). None of the concentrations detected exceeded the health-based and/or ecological ILs specified for residential land use. Elevated arsenic and total chromium concentrations were reported across the Site, however further analyses confirmed that concentrations detected are indicative of natural soil conditions (SLR DSI 2020). Heavy metal impact (nickel, exceeded the EIL specified for urban residential and public open space land uses) was only detected in one sample collected from the Site during previous investigations (Agon DSI 2020). This area has been subsequently remediated and validated as part of the works conducted by SLR. Given that the concentration detected was below the human health IL for residential land uses and the level of remediation works conducted, heavy metals are not considered COPC for soil conditions at the Site.
- Groundwater beneath the wider Project Area was intersected at depths between 2.69 and 3.79 mbgl and inferred to flow in a westerly direction towards coastal mangrove community and outer estuary of Darwin Harbor (located approximately 160 m from the Project Area) (Agon DSI 2020). According to the Agon DSI report (2020), groundwater samples reported dissolved heavy metal concentrations above the nominated ILs adopted for assessing potential impacts to groundwater users and marine aquatic ecosystems.
- Future users of the Site will not extract and use groundwater from beneath the Site and as such groundwater impact in the form of dissolved heavy metals, is not considered to pose an exposure risk to future users of Lots B1, B2 and B3.

Table 14 Conceptual Site Model

Sources		Exposure	Receptors			Complete Source-Pathway-Receptor Linkage
Primary Source	Secondary Sources	Transport Mechanism Possible and Routes of Exposure	Person or Ecological Receptor Potentially Exposed	Receptor Present		
				On-site	Off-site	
None – all known primary sources of impact (i.e. uncontrolled fill, building material and services made out of ACM) have been removed from the Site.	Soil contamination: • None. All known soil impacts (i.e. asbestos) have been removed and resultant excavations validated. Note: Asbestos detected in fill material on neighbouring properties to the east of the Site.	Dispersion • Uptake via plants • Dermal contact • Incidental ingestion • Leaching via percolation Wind Erosion: • Inhalation of dusts Volatilisation • Inhalation	Residents	×	✓	× *does not exist as all known sources have been removed
			Commercial workers	×	✓	× *does not exist as all known sources have been removed
			Intrusive workers	✓	✓	× *does not exist as all known sources have been removed
			People in open spaces	✓	✓	× *does not exist as all known sources have been removed
			Ecological receptors (terrestrial biota)	✓	✓	× *does not exist as all known sources have been removed
	Groundwater Contamination: • Heavy metals	Migration of groundwater and its extraction • Dermal contact	Residents	×	✓	× *although bores exist within the locality, the SPR linkage is not considered viable as groundwater within the locality is not expected to be used for domestic purposes especially given the availability of a reticulated, treated (mains) water supply and low groundwater yield.

Sources		Exposure	Receptors			Complete Source-Pathway-Receptor Linkage
Primary Source	Secondary Sources	Transport Mechanism Possible and Routes of Exposure	Person or Ecological Receptor Potentially Exposed	Receptor Present		
				On-site	Off-site	
		• Incidental ingestion • Inhalation • Terrestrial/ aquatic Groundwater impact is not volatile and therefore exposure pathway associated with the "migration of groundwater – volatilisation – inhalation" is not considered to exist.	Commercial workers	✗	✓	✗ *although bores exist within the locality, the SPR linkage is not considered viable as groundwater within the locality is not expected to be used for commercial purposes especially given the availability of a reticulated, treated (mains) water supply and low groundwater yield. There is no design to establish a bore onsite for future users of the Site.
			Intrusive workers	✓	✓	✗ *does not exist as groundwater is located at depths greater than 2.69 mbgl and as such is unlikely to enter typical excavations/underground service pits located either on site or within the surrounding locality.
			People in open spaces	✓	✓	✗ *does not exist as groundwater is not expected to be used by users of public open spaces.
			Ecological receptors (terrestrial and aquatic biota)	✗ (terrestrial only)	✓	**Potentially Complete** *possible that ground impact (dissolved heavy metals) could migrate offsite to the coastal mangrove communities located approximately 160 m west of the Project Area.

6 Future Site Management Considerations

A "live" sewer main is located along the eastern boundaries of both Lots B2 and B3, and along the southern boundary of Lot B2. Remediation works within 3m of these boundaries were limited due to the presence of this underground service and potential destabilisation of neighbouring fences, retaining walls and structures (e.g., sheds). Remediation works conducted in this area included topsoil stripping (to a depth of 0.3m) and targeted removal of soil where asbestos impact was visually determined (e.g., around the sewer riser).

Contractors conducting works associated with the removal/upgrade of these "live" services were advised to employ precautionary measures such as having safe work method statements and/or work-specific management plans addressing exposure to potentially asbestos impacted soils, unexpected finds protocol and associated training, to ensure workers understood the controls required to be implemented in the unlikely event unexpected asbestos was encountered.

Results of the remediation and validation works associated with the removal/upgrade of the sewer main along the southern boundary of the Site, that were overseen by SLR, are presented in the addendum report titled *"Sewer Easement Remediation and Validation Report, John Stokes Square Redevelopment Lots B1, B2 and B3"*, December 2021 (ref: 680.10679.00200_R13) and should be read in conjunction with this report.

7 Conclusion

Based on the field observations and analytical results obtained for the remediation and validation works conducted at the Site, SLR considers that Lots B1, B2 and B3 are suitably remediated and validated for the proposed high density residential land use, subject to the considerations outlined in this report.

8 Limitations

The following information will assist in understanding the uncertainties relating to the interpretation of the data obtained during this investigation and the recommendations presented in the report and help with assessment and interpretation of the report.

SLR assumes no responsibility for the quality or accuracy of data obtained from external sources, or for occurrences outside the scope of works defined in this report.

All work conducted, and reports produced by SLR are prepared for a particular Client's objective and are based on a specific scope, conditions and limitations, as agreed upon between SLR and the Client. Information and/or report(s) prepared by SLR may therefore not be suitable for any use other than the intended objective.

Before passing on to a third party any information and/or report(s) prepared by SLR, the Client is to inform fully the third party of the objective and scope, and all limitations and conditions, including any other relevant information which applies to the information and/or report(s) prepared by SLR.

It is the responsibility of third parties to investigate fully to their satisfaction if any information and/or report(s) prepared by SLR, is suitable for a specific objective.

Services were conducted in a conscientious and professional manner. The nature of the task, however, and the likely disproportion between any damage or loss which might arise from the work and any report prepared as a result and the cost of our services is such that SLR cannot guarantee that all issues of concern/contamination have been identified.

The report(s) and/or information produced by SLR should not be reproduced and/or presented/reviewed except in full.

APPENDIX B

Remediation Strategy

Memorandum

To:	Bill Kmon	**At:**	Harris Kmon Solutions Pty Ltd
From:	Paul Turyn	**At:**	SLR Consulting Australia Pty Ltd
Date:	3 June 2020	**Ref:**	680.10679.00000-M04-v2.0 20200603.docx
Subject:	Remediation Strategy John Stokes Square - Residential Lots (Lots B1, B2 and B3)		

CONFIDENTIALITY

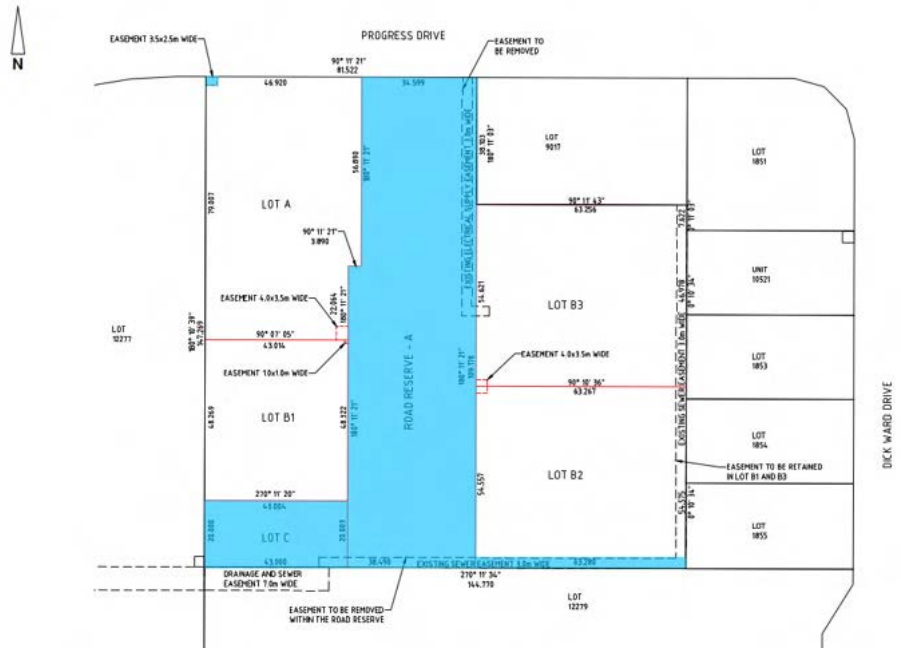
This document is confidential and may contain legally privileged information. If you are not a named or authorised recipient you must not read, copy, distribute or act in reliance on it. If you have received this document in error, please telephone our operator immediately and return the document by mail.

SLR Consulting Australia Pty Ltd (SLR) have been engaged to provide environmental consulting services to support the development works at John Stokes Square in Nightcliff of the Northern Territory. This technical memorandum is intended to provide the Contaminated Lands Auditor (CLA) with a proposed remediation strategy for review prior to commencement of works.

1 Background

John Stokes Square is a recently subdivided parcel of land in the suburb of Nightcliff. The location and subdivided land parcels are shown in **Figure 1.**

Figure 1 Layout and location of John Stokes Square (drawing provided by client)



Following subdivision, SLR understands that John Stokes Square will be subject to multiple future land uses, as described in **Table 1**. Investigation Levels (ILs) and remediation criteria will be applied as required for each area with consideration of these varying land uses.

Table 1 Proposed future land uses of John Stokes Square

Lots or Parcels as described in Figure 1	Proposed future landuse
Lot A	Commercial Industrial (Police Station)
Lots B1, B2, B3	High Density Residential
Road Reserve A, Lot C & blue easements	Land to be gifted to various Authorities unencumbered

Several previous environmental investigations have been undertaken at John Stokes Square, which SLR have reviewed to inform the development of this strategy, including:

- Limited Soil Investigation – Greencap, July 2019
- Detailed Soil Investigation – Greencap, September 2019
- Additional Soil Investigation – Greencap, October 2019
- Detailed Site Investigation – Agon, February 2020
- Detailed Site Investigation revision – Agon, April 2020

SLR understands that Agon Environmental (Agon) carried out remediation works across John Stokes Square, details of which are included within the Detailed Site Investigation report/s. SLR also understands that these works have been reviewed by CLA Jean-Paul Pearce and are considered reliable "with the exception of a minor issue regarding crushed concrete stockpile sampling, reuse and disposal" which is currently being resolved.

2 Scope

The strategy described in this technical memorandum is intended to support the development of Lots B1, B2, B3, , as shown in **Figure 1** (The Site).

3 Objectives

SLR understands the key objectives of this strategy are as follows:

- Ensure all remedial and development works are undertaken in a manner that does not present an unacceptable risk to human health or the environment.
- Ensure the remedial and development works adhere to all applicable legislative requirements, guidelines, and standards.
- Effectively remediate and manage all identified soil impacts within Lots B1, B2, B3, enabling The Site to be utilised for its proposed future land use.

4 Legislative Framework

This site-specific remediation strategy was developed in general accordance with the following guidelines and standards.

- ASC NEPM 2013, "National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended in 2013". National Environment Protection Council.
- WA Department of Health 2009, "Guidelines for the assessment, Remediation and management of Asbestos-contaminated sites in Western Australia"
- AS 4482.1-2005 "Guide to the Sampling and Investigation of Potentially Contaminated Soil. Part 1: Non-volatile and semi-volatile compounds"
- VIC EPA 2009, "Industrial Waste Resource Guidelines – Soil Sampling"
- NSW EPA 2014, "Resource Recovery Order under Part 9, Clause 93 of the Protection of the Environment Operations (Waste) Regulation 2014 – The excavated natural material order 2014."
- NT EPA 2017, "Northern Territory Contaminated Land Guideline"
- NT EPA 2016, "Waste Management and Pollution Control Act."
- NT EPA 2013, "Guidelines for Consultants Reporting on Environmental Issues"

5 Remediation Strategy – Lots B1, B2 and B3

5.1 Earthworks

Following the successful implementation of a remediation strategy across Lot A, the project team proposes to apply the same remediation strategy across Lots B1, B2 and B3 to remove uncontrolled fill material to apparent natural material (either weathered rock or rock) from onsite and characterise the resultant screened soils materials for potential reuse onsite.

The contractor intends to screen construction and demolition rubble from the uncontrolled fill material which may then be suitable for beneficial reuse onsite, pending characterisation sampling and analysis. SLR notes there is an increased risk of ACM in this material.

SLR will be inspecting material while onsite for visual evidence of ACM impact including fresh excavations, screened soil and screened bulk waste.

SLR recommend that any screened material should be further segregated into small, manageable stockpile volumes and not mixed together until laboratory results are received and the material is classified and advice is provided on appropriate reuse or disposal options. The intent of this segregation is to minimise the amount of material which is deemed unsuitable for reuse onsite (or offsite) which may need to be disposed of as waste.

Stockpiles will be segregated and sampled with information recorded within a soil tracking spreadsheet including:

- Stockpile ID label
- Stockpile location
- Estimated volume
- Material description based on visual assessment
- Number of samples collected / sampling frequency achieved
- SLR will document and report tracking of all material on site related to this remediation project.

Further to this, all material excavated that is required to remain on site for either segregation processing, characterisation, or beneficial reuse must be transferred to the contractor proposed stockpile laydown areas. The location of the stockpile laydown area should reduce the need for double handling of the material and not impede upon the later construction/development works on site.

Further stockpile management requirements stipulated within the *Northern Territory Contaminated Land Guidelines* (NTEPA, 2017) includes the following.

- Maintain a log of stockpile locations, the origin of the material, locations of all characterisation and validation sample locations and corresponding sample results;
- Use of an effective liner (such as high-density polyethylene (HDPE) liner) or a sealed surface underneath each stockpile in combination with bunding to prevent run-off, soil erosion, or leaching of contaminants to the underlying strata. Additional to this, where stockpiled material is unavoidably placed on an unsealed portion of the site, interpretation of laboratory analytical results when classifying the stockpile will also consider potential for incidental cross contamination of the stockpile footprint and potential remediation/validation requirements.
- Restrict the maximum height of each stockpile to be no more than three (3) metres, or lower than boundary fence/hoarding heights when within five (5) metres of the boundary;
- Avoiding locating stockpiles:
    - adjacent to, or in close proximity to, site boundaries; and
    - in close proximity to sensitive receptors.
- Ensure stockpiles remain on site for the shortest amount of time;
- Maintain an effective dust and/or odour mitigation cover; and
- Maintain appropriate soil moisture content to reduce dust emissions (particularly during handling).

It is further recommended that, given the previous identification of ACM and asbestos fines, management measures to mitigate potential health risks associated with aerial dispersion of asbestos fibres/fines be implemented including stockpiles securely covered using a geofabric liner or sprinklers installed above stockpiles to keep material sufficiently wet.

5.2 Earthworks program

The proposed earthworks program for the implementation of the remediation strategy is as follows –

- Lot B1 – proposed start date to be confirmed, with excavation, stockpiling and screening works estimated to take 2- 3weeks
- Lot B2 – proposed start date to be confirmed, with excavation, stockpiling and screening works estimated to take 2 – 3 weeks
- Lot B3 - proposed start date to be confirmed, with excavation, stockpiling and screening works estimated to take 2 – 3 weeks

Uncontrolled fill material will be excavated and stockpiled on the adjacent land area within the Road Reserve A (as shown in **Figure 2**). Following stockpiling, the material will be screened to remove the anthropogenic waste materials and screened stockpiles will then be sampled for chemical characterisation and beneficial reuse assessment.

Upon completion of the beneficial reuse assessment, materials deemed suitable will be reinstated within Lots B1, B2 and B3 where the material is deemed geotechnically suitable for further construction activities.

5.3 Supervision onsite

SLR will supervise stripping, excavation and stockpiling works of Lots B1, B2 and B3, similar to the remediation strategy implemented for Lot A. Intermittent visual inspections will be carried out to assess material for potential Asbestos Containing Material.

SLR staff supervising works are deemed to be suitably experienced and competent for asbestos works as per WA DoH (2009) asbestos guidelines.

All lead field staff involved in this project have successfully carried out similar assessments and remediations that have been successfully completed, reviewed and signed off by previous Contaminated Land Auditors (Mark Stuckey, Anthony Lane).

The objectives of this remediation project include the expectation that the remedial and development works will adhere to all applicable legislative requirements, guidelines, and standards. This includes remediation of ACM to the residential (minimal soil access) standards within the WA DoH guidelines (2009) including:

- <0.001% w/w FA/AF
- < 0.04% w/w ACM

To facilitate this, supervision carried out by SLR will include:

- Supervision of excavation works including visual inspection for signs of ACM impact. An SLR representative will be on site at all times during excavation remediation works.
- Detailed visual inspection of excavations at least every hour
- Discussions with civil contractors about the agreed remediation objectives prior to commencement of works and requests that operators call SLR via UHF when pockets of uncontrolled fill are encountered
- Visual inspection of material during and following screening
- Visual inspection of replacement and compaction of any material which is deemed suitable for beneficial reuse on Site. SLR understands that material will be reinstated in lifts, each of which is to be inspected by SLR and an ACM clearance certificate provided.

5.4 Soil sampling

Samples will be collected in accordance with the methodology outlined in **Table 2**.

Table 2 Soil sampling methodology

Activity	Comment / Details
Soil sampling frequencies	• Spoil characterisation samples will collected from the excavated, stockpiled material at a frequency of 1 sample every 70 m^3 with a minimum of three samples per stockpile. Asbestos samples will be sieved and analysed in accordance with WA DOH guidelines for stockpiled material. • Validation samples will be collected from the base of each excavation at a minimum rate of one sample per 25 m^2 of excavation base, with a minimum of one sample collected from each excavation base. Given the low risk of ACM within natural material, asbestos analysis of validation samples will be presence/absence only. • Duplicate samples will be collected at a rate of 1:20 for soil samples. • One equipment rinsate (taken from re-useable equipment) will be collected and analysed for each day of sampling. • Where practicable, coordinates of sample locations will be recorded with a handheld GPS.
Sample collection	• Sample collection will be undertaken in general accordance with AS4482.1-2005 and SLR SOPs. Dedicated disposable nitrile gloves and laboratory supplied sample containers will be used for sample collection.
Sample preservation	• Samples will be placed in laboratory supplied jars and stored as close to 4°C as practicable, in insulated chilled containers while on site and in transit to the laboratory.
Sample submission	• Chain of custody (COC) documentation will be completed at the time of sample collection and will accompany the samples to the nominated laboratory. • All samples will be submitted to a National Association of Testing Authorities (NATA) accredited laboratory for analysis. • 50% of spoil characterisation samples will be submitted for analysis, with the rest held by the laboratory for further analysis if required should substantial variability[#1] in analytical results require further statistical assessment. • 50% of validation samples will be submitted for analysis, with the rest held by the laboratory for further analysis if required should substantial variability in analytical results require further statistical assessment.

#1 Substantial variability will be assessed via a coefficient of variation (CV) assessment as per the NSW EPA Sampling Design Guidelines (1995) with stockpiles with a CV value >1 considered to have substantial variability.

5.5 Analytical assessment

Spoil characterisation and validation samples will be submitted to a NATA accredited laboratory for analysis.

Scheduled soil samples will be analysed for:

- Total Recoverable Hydrocarbons (TRH)
- Benzene, toluene, ethylbenzene and xylene (BTEX)
- OCP/OPP
- Asbestos (WA DoH/NEPM samples)
- Asbestos presence/absence
- 8 priority metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, and zinc)
- Representative samples will be analysed for soil characterisation as per the ASC NEPM

All non-scheduled samples will be placed on hold at the laboratory should further analysis be required as part of the characterisation and validation process.

SLR believe that the proposed analytical suite will be suitable for waste classification and offsite disposal and beneficial reuse assessment (when combined with the NEPM soil classification data).

5.6 Screening criteria

The nominated screening criteria will be selected to assess the potential risks posed to current and future users of the Site and sites at which material may be reused. The nominated screening criteria will be selected from the following:

ASC NEPM[1]:

- Health based Investigation Levels (HIL) for residential B sites
- Soil Health Screening Levels (HSL) for vapour intrusion – residential B sites
- Ecological Investigation Level (EIL) for Urban residential sites
- Ecological Screening Level (ESL) for Urban residential sites

Management limits for Total Petroleum Hydrocarbon (TPH) fractions in soil, Urban residential sites

WA DoH[2]:

General Contamination Criteria for protecting the public from asbestos-contaminated sites. For clarity, screening criteria for asbestos will be high density residential (Residential B) as per **Table 7** of the NEPM (ASC) 2013 Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater (copied below)–

Table 7. Health screening levels for asbestos contamination in soil

	Health Screening Level (w/w)			
Form of asbestos	Residential A[1]	Residential B[2]	Recreational C[3]	Commercial/ Industrial D[4]
Bonded ACM	0.01%	0.04%	0.02%	0.05%
FA and AF[5] (friable asbestos)	0.001%			
All forms of asbestos	No visible asbestos for surface soil			

Upon receipt of lab samples, a beneficial reuse assessment in accordance with the ASC NEPM (2013) will be undertaken. A letter report will be provided outlining findings, recommendations and suitable reuse options for material.

[1] National Environment Protection Council MAY 2013, "*National Environment Protection (Assessment of Site Contamination) Measure 1999*".
[2] Western Australian Department of Health (WA DOH) MAY 2009, "*Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia*".

Due to current COVID-19 travel restrictions, photographic records of work will be included in reports.

If unexpected contamination is identified, the CLA will be contacted to discuss management options.

5.7 Air monitoring

Air monitoring will be conducted for the duration of the stripping, stockpiling and characterisation works as a precautionary measure.

Airborne asbestos monitoring will be conducted at the boundaries of the site (north, south, east and west) and are static locations.

Monitors will be up at the commencement of the shift (approximately 0700) and collected at the completion of site works (ranges from 1600 – 1700).

Each monitor will be calibrated as per SLRs internal NATA accredited procedure and set at a flow rate of 1 L/minute Monday to Friday and 2 L/min on Saturday – as the work shift is shorter (0700 – 1300), so the flow rate is increased to ensure an appropriate sampling volume is achieved over the shorter shift.

SLR is NATA accredited in our Darwin laboratory to conduct all sampling and analysis of filters. Our accreditation number is 3130 and I have attached a copy of our scope of accreditation to this memorandum. Air monitoring will be conducted in accordance with the Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Dust, 2nd Edition [NOHSC: 3003 (2005)].

All air monitoring results will be compared to the public health exposure standard of 0.01 fibres/mL.

Consideration will be given to the asbestos air-quality limit for protecting the public around contaminated sites of 0.01 fibres/mL, as endorsed by the enHealth Council in Management of asbestos in the non-occupational environment 2005 document (enHealth 2005).

Where the results of the airborne asbestos monitoring show that respirable asbestos fibre levels exceed the action levels outlined in **Table 3**, action must be taken immediately.

Table 3 Air monitoring action levels

Action Level	Control	Action
Less than 0.01 fibres/ml	No new control measures are necessary	• Continue with current control measures
At 0.01 fibres/ml or more than 0.01 fibres/ml but less than or equal to 0.02 fibres/ml	1. Review	• Review control measures
	2. Investigate	• Investigate the cause
	3. Implement	• Implement additional or alternative controls to eliminate or minimise exposure and prevent further release • Communicate any additional controls during daily pre-start meeting
More than 0.02 fibres/ml	4. Stop removal work	• Cease excavation / transport of material
	5. Notify Regulator	• Notify the Head Contractor, followed by the regulator (NT WorkSafe) both verbally and in written communication

Action Level	Control	Action
	6. Investigate the cause	• Conduct a thorough assessment across the Site to determine the cause. • Consult with all personnel involved in the works • Determine ongoing mitigation measures • Continue to carry out air-monitoring to ensure further controls have mitigated the problem

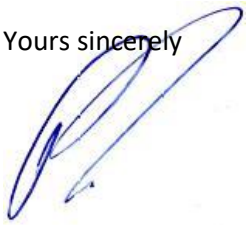
Table adapted from the Code of Practice: *How to Safely Remove Asbestos*

6 Closure

We trust the above remediation strategy is adequate for the next phase of works at the John Stokes Square redevelopment project.

If you have any further queries or would like to discuss any of the above in detail, please do not hesitate in contacting either myself to discuss.

Yours sincerely



PAUL TURYN
Principal Environmental Engineer

AUSTRALIAN
ENVIRONMENTAL AUDITORS

AEA Ref: EA0729-C3 27 May 2020

Ms Sinead Redmond
Project Management Lead, HK Solutions
On behalf of Department of Infrastructure, Planning and Logistics

Email: sinead.redmond@hksolutions.com.au

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the proposed remediation strategy for the management of the remediation and construction works on Lot B1, B2 and B3 (the residential sites). Following discussions with DIPL we understand that due to the identification of geotechnically unsuitable material during excavations on the commercial lot (Lot A), and with the aim of further reducing the level of residual contamination, the original strategy was changed. I am supportive of undertaking additional works which will result in a lower level of long-term risk to the community.

The following documents were reviewed:

- SLR (14 May 2020) Memorandum: Remediation Strategy, John Stokes Square – Residential Lots (Lots B1, B2 and B3) (ref. Appendix J - DRAFT Remediation Strategy.docx); and
- Halikos Construction (May 2020) Construction Environmental Management Plan Revision 2.0, John Stokes Square, Broad Scale Site Remediation and Construction Preparation Works (ref. Broad Scale Remediation).

I provide the following comments:

Remediation Strategy

1. Section 1, last paragraph. The Agon reports have been reviewed and considered reliable with a note that we are resolving a minor issue regarding the crushed concrete stockpile sampling, reuse and disposal
2. Section 4. Please include NT EPA publications
3. Section 5.1,
   a) Paragraph 2. It should be noted that there is an increased risk of ACM in this material.
   b) Will SLR be inspecting the oversize screened material for ACM?
   c) Tracking of material should be documented and reported by SLR.
   d) Final paragraph. Given the previous identification of ACM and asbestos fines, these controls should be implemented from the start unless additional justification is provided.

4. Section 5.3. As per previous advice, please provide additional detail on the proposed site supervision and how this ties into the objectives of the works. For example, if the objective is to ensure the fill is as completely free of asbestos as possible, then a higher level of supervision would be necessary than if the objective is to remove geotechnically unsuitable material and any asbestos observed with risks from any residual asbestos observed managed via capping, etc.
5. Section 5.7. Air monitoring criteria should be public health (<0.01 f/mL) as monitoring is proposed on the site boundary, the occupational criteria (<0.1 f/mL) is only appropriate for workers.
6. The reuse of soil onsite is understood to be placed down in layers for compaction purposes and each lift is to be inspected for ACM by SLR with a clearance certificate issued for each lift. If ACM is observed, it will need to be removed and validated. Please note that this was the agreed approach for the commercial area, but we understand that this was not undertaken. This process provides an important extra check for ACM and needs to be undertaken for the residential allotments.
7. How will the decision regarding material reuse on-site/reuse off-site/disposal be reported?
8. Due to current COVID-19 travel restrictions, please include photographic record of the works.
9. If unexpected contamination is identified, please call to discuss the management strategy.

Construction Environmental Management Plan (CEMP)

The CEMP details the objectives, key performance indicators and targets, and environmental management measures to be implemented during the remediation and construction works. This includes erosion and sedimentation, dust and air quality, soil, waste, and asbestos management amongst other things. It also details training, including induction training for workers.

1. Due to the presence of asbestos please ensure the site is fenced if this is not already done.
2. Please include an unexpected finds protocol.
3. Appendix I.
    a. The investigations to date have identified asbestos in soil which is understood to remain onsite. The AMP should be revised to reflect this and any other associated implications.
    b. Section 8 proposes a weekly 2 hours inspection for asbestos, this is not consistent with the remediation strategy.

Please contact me if you have any questions regarding this letter.

Regards,

Australian Environmental Auditors

Jean Paul Pearce

EPA Appointed Environmental Auditor (Contaminated Land)

2.2	Site Address:	John Stokes Square, 47 Progressive Drive, Nightcliff, NT		
2.3	Asbestos Removal Locations:	This Clearance Certificate is issued in relation to visual inspections conducted on the 200 mm thick lifts of soil material used to reinstate excavations and trenches created during the remediation of Lots B1, B2 and B3 (herein referred to as "the Site"). **Figure 1** shows the extent of the Site. Asbestos Containing Materials (ACM) debris was identified in the fill material present across Lots B1, B2 and B3, and within the fill material surrounding a number of shallow abandoned utility services. Some abandoned services were also found to be constructed out of ACM. Fill material across the Site was removed and screened, with asbestos impacted soils and ACM material being segregated into waste asbestos stockpiles for appropriate offsite disposal. As part of the remediation process, validation samples were collected from the base of the excavations and trenches to confirm that all ACM related impact had been adequately removed. **Figures 2 – 4** show the extent of the excavations and validation sample locations collected. Spoil removed from the excavations were sampled in accordance with the WA DOH 2009 guidelines to determine suitability for Site reuse. Spoil confirmed through analytical results as being suitable for Site reuse were used to reinstate the excavations and trenches created across the Site. As part of the validation process, the surface of each 200mm thick lift of spoil material used to reinstate the excavations and trenches were visually inspected for visible ACM debris. This Clearance Certificate is issued in relation to these inspections.

2	ASBESTOS REMOVAL DETAILS	
2.5	Asbestos Removal Contractor Supervisor & Licence Number:	Tony Karambetis CPCCDE3015A
2.6	Details of Asbestos Removal Activities and Area Inspected:	ACM debris were encountered in fill material present across the Site and within the fill material used to backfill underground services. ACM debris and associated impacted soils were removed in accordance with the Remediation Strategy (*SLR reference: 680.106.00000-M04-v2.0 20200603*) and the details are as follows: - Uncontrolled fill material present across the Site was excavated to apparent natural soil and any ACM debris encountered was segregated and placed into designated waste asbestos stockpiles prior to being disposed offsite to the Shoal Bay Waste Management Facility (SBWMF) as Special Waste (Asbestos). Spoil generated from the excavation of uncontrolled fill material inspected for any evidence of ACM debris and where identified, segregated and disposed of appropriately to the SBWMF accordingly. The bases and walls of the resultant excavations were inspected for the presence of visible ACM. Soil samples were also collected from the base of the resultant excavations to validate that all impacted soil and material had been adequately removed. Analytical results are presented under a separate cover. - Following the excavation of uncontrolled fill material across the Site, the abandoned underground services, including, stormwater pipes, sewer pipes, water distribution pipes, and electrical and communication services were removed successively from each lot. Numerous fragments of ACM debris and services constructed out of ACM (e.g. fire hydrant pipe, conduit pipe used to house electrical cables) were noted during the removal of these abandoned services. Services constructed out of ACM, ACM debris and associated impacted soils were segregated and stockpiled separately as asbestos waste for appropriate offsite disposal. The walls and bases of resultant trenches were inspected for the presence of visible ACM. Soil samples were also collected from the base and walls of the resultant trenches to validate that all impacted soil and material had been adequately removed. Analytical results are presented under a separate cover. - Spoil generated during the excavation of uncontrolled fill material and abandoned underground services were stockpiled and screened to remove anthropogenic waste (e.g., construction debris). During the screening process, the spoil material was visually inspected for any evidence of ACM debris. Soil samples were collected from the stockpiled spoil to determine whether the material was suitable for site reuse. Analytical results are presented under a separate cover. - Stockpiles found to be impacted with ACM, asbestos fines/friable asbestos were removed by a licensed asbestos removalist, Northern Trade Solution (NTS) for appropriate offsite disposal to the SBWMF. - Following the completion of visual inspections and validation soil sampling, the excavations and trenches were backfilled with spoil material characterised (via laboratory analysis) as being suitable for reuse onsite. Visual inspections were conducted during the reinstatement and the final visual clearance of each lot was provided as follows: - **Residential Lot B1** - The surface of Lot B1 was raised by five 200mm thick lifts overall. Each 200 mm lift of reinstated material was visually inspected by the Environmental Consultant for ACM debris by systematically walking over the area in a grid like basis.

2	ASBESTOS REMOVAL DETAILS	
		No visible ACM debris was encountered during the visual inspections for Lot B1 and therefore deemed suitable for future construction works. - **Residential Lot B2** The surface of Lot B2 was raised by four 200mm thick lifts overall. Each 200 mm lift of reinstated material was visually inspected by the Environmental Consultant for ACM debris by systematically walking over the area in a grid like basis. No visible ACM debris was encountered during the visual inspections for Lot B2 and therefore deemed suitable for future construction works. - **Residential Lot B3** The surface of Lot B3 was raised by five 200mm lifts overall. Each 200 mm lift of reinstated material was visually inspected by the Environmental Consultant for ACM debris by systematically walking over the area in a grid like basis. No visible ACM debris was encountered during the visual inspections for Lot B3 and therefore deemed suitable for future construction works.

3	CLEARANCE INSPECTION – VISUAL	
3.1	Method:	Visual inspections were undertaken by a suitably qualified environmental consultant from SLR consulting Pty Ltd (SLR) of the excavated areas and trenches created due to remediation work conducted at the Site, and of the surface of each 200 mm lift of material used to reinstate the excavations and trenches and to raise the surface of the Site to design levels. The base and walls of the excavation and trenches were visually inspected for ACM debris and representative soil samples were also collected from the base of excavation in accordance with the Remediation Strategy developed for the Site. Analytical results are discussed under a separate cover. Asbestos material encountered during the removal of fill material and abandoned underground services were removed in accordance with the Code of Practice How to Safely Remove Asbestos 2011. Refer to **Figures 2 - 4** for the areas where visual clearances for asbestos related impact have been undertaken at the Site.
3.2	Visual Summary:	It is the opinion of Robin Birua of SLR that the excavated area and trenches associated with the removal of abandoned underground services mentioned in Section 2.6 and surfaces of each 200 mm lift of reinstated material, have been visually inspected, as far as reasonably practicable and are free of visible ACM debris at the surfaces inspected (i.e., walls and bases of the excavations/trenches, reinstated surfaces). Refer to **Appendix B** for representative photographs.

3	CLEARANCE INSPECTION – VISUAL	
3.3	Limitations:	It should however be noted that: • The Visual Clearance Inspection and Clearance Certificate are limited to accessible, visible surfaces as detailed Section 2.6 only. • Inspections are conducted in a conscientious and professional manner. The nature of the task and the likely disproportion between any damage or loss which might arise from the work or Clearance Certificate prepared and the cost of our services, is such that SLR cannot guarantee that all asbestos materials/issues of concern have been identified and/or addressed. • Unless specified in this Clearance Certificate, this Clearance Certificate does not guarantee that the dust present in or around those areas mentioned in Section 2.3 and Section 2.6 of this Clearance Certificate are free of asbestos contamination. The inspection is for visible ACM as detailed in Section 2.6 only. • It is possible that ACM are present in areas that were inaccessible/visually obscured during the inspection. It is also possible that ACM may be present beneath the ground surface of areas adjacent to the area excavated, as well as beneath the base of the area excavated. • If any ACM or assumed ACM are encountered on site, access to the materials should be appropriately restricted and advice sought from a suitably qualified and experienced consultant. • The inspection was carried out at the time of the completion of the remediation works and was dependent upon site conditions at that time. • SLR accepts no responsibility or liability for the completeness of the removal by the appointed licensed asbestos removal contractor. The appointed licensed asbestos removal contractor is responsible for ensuring all work is conducted in a safe and competent manner by suitably trained staff, the necessary approvals are obtained from regulatory authorities prior to starting any asbestos removal or maintenance activities (if applicable) and that work methods and procedures comply with the relevant legislation, codes of practice and industry standards, as required.

4	CLEARANCE INSPECTION - ASBESTOS AIRBORNE FIBRE MONITORING	
4.1	Background Monitoring:	Air monitoring for airborne fibres was conducted for each day intrusive works were carried out as part of the remediation works. Control (as required) and background airborne fibre monitoring was conducted, in general accordance with Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Dust, 2nd Edition [NOHSC: 3003 (2005)].
4.2	Clearance Monitoring:	Clearance airborne fibre monitoring was not requested by the Client. It therefore does not form part of this Clearance Certificate.
4.2	Results:	The analysis of all asbestos airborne fibre monitoring was undertaken by SLR at our NATA accredited laboratory. All airborne asbestos monitoring results showed less than the minimum detection limit of the method used which is 0.01 fibres/mL (refer to the SLR Airborne Asbestos Monitoring Report, Ref: 680.10679.0000-JLF-15 through to 680.10679.0000-JLF-61).

5	RE-OCCUPATION
5.1	**It is the opinion of SLR that the area as detailed in Section 2.3 of this Clearance Certificate is fit for re-occupation and for normal works to proceed**. The asbestos removal work area and the surrounding area have been inspected, as far as reasonably practicable, and are considered to be free of visible assumed or suspected asbestos debris. Within the scope of works, all asbestos has been removed as per **Section 2.6** of this Clearance Certificate (please note the limitations in **Section 3.3**). While SLR carries out the work to the best of our ability, we totally exclude any loss or damages which may arise from services provided to the Client and/or associated parties. This Clearance Certificate and/or information produced by SLR should not be reproduced and/or presented/reviewed except in full.

Company name:	SLR Consulting (NT)
Contact name:	Gemma Sheridan
Project name:	DIPL JOHN STOKES SQUARE -RESIDENTIAL REMEDIATION
Project ID:	680.10679 DIPL JOHN STOKES SQUARE
Turnaround time:	1 Day
Date/Time received	Sep 23, 2020 10:20 AM
Eurofins reference	745824

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Michael Morrison on phone : 03 8564 5933 or by email: MichaelMorrison@eurofins.com

Results will be delivered electronically via email to Gemma Sheridan - gsheridan@slrconsulting.com.

Note: A copy of these results will also be delivered to the general SLR Consulting (NT) email address.

Attention:	Gemma Sheridan
Report	745824-AID
Project Name	DIPL JOHN STOKES SQUARE -RESIDENTIAL REMEDIATION
Project ID	680.10679 DIPL JOHN STOKES SQUARE
Received Date	Sep 23, 2020
Date Reported	Sep 24, 2020

Methodology:

Asbestos Fibre Identification	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. *NOTE: Positive Trace Analysis results indicate the sample contains detectable respirable fibres.*
Unknown Mineral Fibres	Mineral fibres of unknown type, as determined by PLM with DS, may require another analytical technique, such as Electron Microscopy, to confirm unequivocal identity. *NOTE: While Actinolite, Anthophyllite and Tremolite asbestos may be detected by PLM with DS, due to variability in the optical properties of these materials, AS4964 requires that these are reported as UMF unless confirmed by an independent technique.*
Subsampling Soil Samples	The whole sample submitted is first dried and then passed through a 10mm sieve followed by a 2mm sieve. All fibrous matter greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) is employed. *NOTE: Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis, in accordance with AS 4964-2004.*
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated for identification by PLM and DS. Where required, interfering matrices may be removed by disintegration using a range of heat, chemical or physical treatments, possibly in combination.The resultant material is then further examined in accordance with AS 4964 - 2004. *NOTE: Even after disintegration it may be difficult to detect the presence of asbestos in some asbestos-containing bulk materials using PLM and DS. This is due to the low grade or small length or diameter of the asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials. Vinyl/asbestos floor tiles, some asbestos-containing sealants and mastics, asbestos-containing epoxy resins and some ore samples are examples of these types of material, which are difficult to analyse.*
Limit of Reporting	The performance limitation of the AS 4964 (2004) method for non-homogeneous samples is around 0.1 g/kg (equivalent to 0.01% (w/w)). Where no asbestos is found by PLM and DS, including Trace Analysis, this is considered to be at the nominal reporting limit of 0.01% (w/w). The NEPM screening level of 0.001% (w/w) is intended as an on-site determination, not a laboratory Limit of Reporting (LOR), per se. Examination of a large sample size (e.g. 500 mL) may improve the likelihood of detecting asbestos, particularly AF, to aid assessment against the NEPM criteria. Gravimetric determinations to this level of accuracy are outside of AS 4964 and hence NATA Accreditation does not cover the performance of this service (non-NATA results shown with an asterisk). *NOTE: NATA News March 2014, p.7, states in relation to AS 4964: "This is a qualitative method with a nominal reporting limit of 0.01 % " and that currently in Australia "there is no validated method available for the quantification of asbestos".This report is consistent with the analytical procedures and reporting recommendations in the NEPM and the WA DoH.*

Project Name DIPL JOHN STOKES SQUARE -RESIDENTIAL REMEDIATION
Project ID 680.10679 DIPL JOHN STOKES SQUARE
Date Sampled Sep 22, 2020
Report 745824-AID

Client Sample ID	Eurofins Sample No.	Date Sampled	Sample Description	Result
STP30-06	20-Se38585	Sep 22, 2020	Approximate Sample 793g Sample consisted of: Brown coarse-grained clayey soil, brick, plaster fragment and rocks	No asbestos detected at the reporting limit of 0.001% w/w.* Organic fibre detected. No trace asbestos detected.
STP34-VAL-1	20-Se38623	Sep 22, 2020	Approximate Sample 51g Sample consisted of: Brown coarse-grained soil and rocks	No asbestos detected at the reporting limit of 0.01% w/w. Organic fibre detected. No trace asbestos detected.
STP35-VAL-1	20-Se38624	Sep 22, 2020	Approximate Sample 39g Sample consisted of: Brown coarse-grained soil and rocks	No asbestos detected at the reporting limit of 0.01% w/w. Organic fibre detected. No trace asbestos detected.
STP36-VAL-1	20-Se38625	Sep 22, 2020	Approximate Sample 44g Sample consisted of: Brown coarse-grained soil and rocks	No asbestos detected at the reporting limit of 0.01% w/w. Organic fibre detected. No trace asbestos detected.
STP37-VAL-1	20-Se38626	Sep 22, 2020	Approximate Sample 34g Sample consisted of: Brown coarse-grained soil and rocks	No asbestos detected at the reporting limit of 0.01% w/w. Organic fibre detected. No trace asbestos detected.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Samples were analysed on an 'as received' basis.
4. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
5. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

Units

% w/w: weight for weight basis	grams per kilogram
Filter loading:	fibres/100 graticule areas
Reported Concentration:	fibres/mL
Flowrate:	L/min

Terms

Dry	Sample is dried by heating prior to analysis
LOR	Limit of Reporting
COC	Chain of Custody
SRA	Sample Receipt Advice
ISO	International Standards Organisation
AS	Australian Standards
WA DOH	Reference document for the NEPM. Government of Western Australia, Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia (2009), including supporting document Recommended Procedures for Laboratory Analysis of Asbestos in Soil (2011)
NEPM	National Environment Protection (Assessment of Site Contamination) Measure, 2013 (as amended)
ACM	Asbestos Containing Materials. Asbestos contained within a non-asbestos matrix, typically presented in bonded and/or sound condition. For the purposes of the NEPM, ACM is generally restricted to those materials that do not pass a 7mm x 7mm sieve.
AF	Asbestos Fines. Asbestos containing materials, including friable, weathered and bonded materials, able to pass a 7mm x 7mm sieve. Considered under the NEPM as equivalent to “non-bonded / friable”.
FA	Fibrous Asbestos. Asbestos containing materials in a friable and/or severely weathered condition. For the purposes of the NEPM, FA is generally restricted to those materials that do not pass a 7mm x 7mm sieve.
Friable	Asbestos-containing materials of any size that may be broken or crumbled by hand pressure. For the purposes of the NEPM, this includes both AF and FA. It is outside of the laboratory’s remit to assess degree of friability.
Trace Analysis	Analytical procedure used to detect the presence of respirable fibres in the matrix.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram | **mg/L:** milligrams per litre | **ug/L:** micrograms per litre

ppm: Parts per million | **ppb:** Parts per billion | **%:** Percentage

org/100mL: Organisms per 100 millilitres | **NTU:** Nephelometric Turbidity Units | **MPN/100mL:** Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

No. of samples analysed	: 4		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Amendment (23/09/2020): This report has been amended as a result of a request to change sample identification numbers (IDs) received by ALS from Robin Birua on 23/09/20. All analysis results are as per the previous report.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EN2006388**	Page	: 1 of 4
Amendment	: **1**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Newcastle
Contact	: Sarah Dorherty	Telephone	: +61 2 4014 2500
Project	: 680.10679 John Stokes Square	Date Samples Received	: 23-Sep-2020
Site	: ----	Issue Date	: 23-Sep-2020
Sampler	: JAMES, ROBIN BIRUA	No. of samples received	: 4
Order number	: ----	No. of samples analysed	: 4

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis		
		Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation
EA200: AS 4964 - 2004 Identification of Asbestos in Soils							
Snap Lock Bag - ACM/Asbestos Grab Bag (EA200)							
Val-T-1a, Val-149-1, Val-149-2, Val-149-3	**18-Sep-2020**	**----**	----	----	**23-Sep-2020**	17-Mar-2021	✓

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

No. of samples received	: 8		
No. of samples analysed	: 5		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EN2008222**	Page	: 1 of 4
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Newcastle
Contact	: Julie McDowell	Telephone	: +61 2 4014 2500
Project	: 680.10679 John Stokes Square	Date Samples Received	: 04-Dec-2020
Site	: ----	Issue Date	: 08-Dec-2020
Sampler	: ROBIN BIRUA	No. of samples received	: 8
Order number	: ----	No. of samples analysed	: 5

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).

  - Requested Deliverables
- **Sample #16 received one VOC vial empty.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order	: **ES2024787**	Page	: 1 of 19
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 21-Jul-2020 16:00
Order number	: ----	Date Analysis Commenced	: 23-Jul-2020
C-O-C number	: 1	Issue Date	: 24-Jul-2020 16:59
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 16		
No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 21-Jul-2020
Order number	: ----	Date Analysis Commenced	: 23-Jul-2020
C-O-C number	: 1	Issue Date	: 24-Jul-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 16		
No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

				Method Blank (MB) Report	Laboratory Control Spike (LCS) Report

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2024787**	Page	: 1 of 10
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 21-Jul-2020
Site	: ----	Issue Date	: 24-Jul-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty	No. of samples received	: 16
Order number	: ----	No. of samples analysed	: 16

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Dissolved Mercury by FIMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Pesticides by GCMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Dissolved Metals by ICP-MS - Suite A	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
Pesticides by GCMS	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 6.1 and Table 1 (14 day holding time).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM 2013 with Confirmation of Identification by AS 4964 - 2004 Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270E Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270E. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260D. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270E Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260D Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

No. of coolers/boxes	: 4	Temperature	: 28.6' C
Receipt Detail	:	No. of samples received / analysed	: 107 / 63

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- 28/7/2020: This is an updated SRN which indicates the removal of analysis for samples CHAR-SP and CHAR-VAL as requested.
- **Samples #101 and #107 were not received.**
- **Unable to conduct Clay Content for samples #1 and #2 due to limited volume received.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Melbourne.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Mercury by FIMS : EG035F		
RINSATE [23-07-2020]	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
RINSATE [23-07-2020]	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

ES2025094-108 : [23-Jul-2020] : RINSATE [23-07-2020]

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EP080: Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005: Poor precision was obtained for Chromium on sample ES2025094-60. Results have been confirmed by re-extraction and reanalysis.
- EG005: Poor precision was obtained for Chromium on sample ES2025094-93. Results have been confirmed by re-extraction and re-analysis.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres

- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- ED007 and ED008: When Exchangeable Al is reported from these methods, it should be noted that Rayment & Lyons (2011) suggests Exchange Acidity by 1M KCl - Method 15G1 (ED005) is a more suitable method for the determination of exchange acidity (H+ + Al3+).
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.
- EA200: N/A - Not Applicable

ALS Environmental

QUALITY CONTROL REPORT

Work Order	: **ES2025094**	Page	: 1 of 32
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 24-Jul-2020
Order number	: 680.10679	Date Analysis Commenced	: 25-Jul-2020
C-O-C number	: ----	Issue Date	: 30-Jul-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 107		
No. of samples analysed	: 63		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Uyen Dalkin	Approved Asbestos Identifier	Melbourne Asbestos, Springvale, VIC
Vanessa Phung	Team Leader - Asbestos	Melbourne Asbestos, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2025094**	Page	: 1 of 21
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 24-Jul-2020
Site	: ----	Issue Date	: 30-Jul-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch	No. of samples received	: 107
Order number	: 680.10679	No. of samples analysed	: 63

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	ES2025094--060	V58	**Chromium**	7440-47-3	26.3 %	0% - 20%	**RPD exceeds LOR based limits**
EG005(ED093)T: Total Metals by ICP-AES	ES2025094--093	STP5-2	**Chromium**	7440-47-3	21.2 %	0% - 20%	**RPD exceeds LOR based limits**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Pesticides by GCMS	0	13	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	16	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Pesticides by GCMS	0	13	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	16	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 6.1 and Table 1 (14 day holding time).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM 2013 with Confirmation of Identification by AS 4964 - 2004 Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Leachable Metals by ICPMS - Suite A	EG020A-C	SOIL	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020: The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270E Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270E. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260D. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270E Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260D Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001-PR	SOIL	In house: Referenced to Rayment and Higginson 4B1, 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM (2013) Schedule B(3) (Method 103)
Exchangeable Cations Preparation Method	ED007PR	SOIL	In house: Referenced to Rayment & Higginson (1992) method 15A1. A 1M NH4Cl extraction by end over end tumbling at a ratio of 1:20. There is no pretreatment for soluble salts. Extracts can be run by ICP for cations.
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of reagent grade water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
ASLP for Non & Semivolatile Analytes	EN60a	SOIL	In house QWI-EN/60 referenced to AS4439.3 Preparation of Leachates
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Organic Matter	EP004-PR	SOIL	In house: Referenced to AS1289.4.1.1 - 1997. Dichromate oxidation method after Walkley and Black. This method is compliant with NEPM (2013) Schedule B(3) (Method 105)
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

30.7.20 5819, V132A, SV25, M-A2/C Newcastle

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **31/07/20: This is an updated SRA which indicates additional analysis.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples received	: 15		
No. of samples analysed	: 15		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005: Poor precision was obtained for Chromium on sample ES2025253-1. Results have been confirmed by re-extraction and re-analysis.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- Amendment (31/07/2020): This report has been amended and re-released to allow the reporting of additional analytical data. Suite S-26, S-12 added to sample #12.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.

- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.
- EA200: N/A - Not Applicable

C-O-C number	: ----	Issue Date	: 04-Aug-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 15		
No. of samples analysed	: 15		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2025253**	Page	: 1 of 11
Amendment	: **1**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 28-Jul-2020
Site	: ----	Issue Date	: 04-Aug-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty	No. of samples received	: 15
Order number	: ----	No. of samples analysed	: 15

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	ES2025253--001	STP8-1	**Chromium**	7440-47-3	22.1 %	0% - 20%	**RPD exceeds LOR based limits**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Pesticides by GCMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard

TRH - Semivolatile Fraction	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Leachable Metals by ICPMS - Suite A	EG020A-C	SOIL	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020: The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
TCLP for Non & Semivolatile Analytes	EN33a	SOIL	In house QWI-EN/33 referenced to USEPA SW846-1311: The TCLP procedure is designed to determine the mobility of both organic and inorganic analytes present in wastes. The standard TCLP leach is for non-volatile and Semivolatile test parameters.
ASLP for Non & Semivolatile Analytes	EN60a	SOIL	In house QWI-EN/60 referenced to AS4439.3 Preparation of Leachates
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.

Preparation Methods	Method	Matrix	Method Descriptions
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Unable to conduct S-26, S-12 for samples 13, 14, 15, 16, as soil jars not suplied.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Mercury by FIMS : EG035F		
RINSATE	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
RINSATE	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **ES2025256**	Page	: 1 of 34
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 29-Jul-2020 08:30
Order number	: ----	Date Analysis Commenced	: 29-Jul-2020
C-O-C number	: ----	Issue Date	: 03-Aug-2020 15:49
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 34		
No. of samples analysed	: 34		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Aleksandar Vujkovic	Laboratory Technician	Newcastle - Inorganics, Mayfield West, NSW
Alexander Ristoski	Laboratory Technican	Newcastle - Asbestos, Mayfield West, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Dian Dao	Senior Chemist - Inorganics	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- ALS is not NATA accredited for the analysis of Exchangeable Cations on Alkaline Soils when performed under ALS Method ED006.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005: Poor spike recovery was obtained for Chromium on sample ES2025256-25. Results have been confirmed by re-extraction and re-analysis.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- ED007 and ED008: When Exchangeable Al is reported from these methods, it should be noted that Rayment & Lyons (2011) suggests Exchange Acidity by 1M KCl - Method 15G1 (ED005) is a more suitable method for the determination of exchange acidity (H+ + Al3+).

- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.
- EA200: N/A - Not Applicable

Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 34		
No. of samples analysed	: 34		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2025256**	Page	: 1 of 14
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 29-Jul-2020
Site	: ----	Issue Date	: 03-Aug-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty	No. of samples received	: 34
Order number	: ----	No. of samples analysed	: 34

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EG005(ED093)T: Total Metals by ICP-AES	ES2025256--025	STP10-4	**Chromium**	7440-47-3	39.5 %	70.0-130%	**Recovery less than lower data quality objective**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Pesticides by GCMS	0	3	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	3	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Pesticides by GCMS	0	3	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	3	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001	SOIL	In house: Referenced to Rayment and Lyons (2011) 4B3 (mod.) or 4B4 (mod.) 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM (2013) Schedule B(3)
pH (1:5)	EA002	SOIL	In house: Referenced to Rayment and Lyons 4A1 and APHA 4500H+. pH is determined on soil samples after a 1:5 soil/water leach. This method is compliant with NEPM (2013) Schedule B(3)
Electrical Conductivity (1:5)	EA010	SOIL	In house: Referenced to Rayment and Lyons 3A1 and APHA 2510. Conductivity is determined on soil samples using a 1:5 soil/water leach. This method is compliant with NEPM (2013) Schedule B(3)
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 6.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM 2013 with Confirmation of Identification by AS 4964 - 2004 Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Exchangeable Cations on Alkaline Soils	ED006	SOIL	In house: Referenced to Soil Survey Test Method C5. Soluble salts are removed from the sample prior to analysis. Cations are exchanged from the sample by contact with alcoholic ammonium chloride at pH 8.5. They are then quantitated in the final solution by ICPAES and reported as meq/100g of original soil.
Exchangeable Cations	ED007	SOIL	In house: Referenced to Rayment & Lyons (2011) Method 15A1. Cations are exchanged from the sample by contact with Ammonium Chloride. They are then quantitated in the final solution by ICPAES and reported as meq/100g of original soil. This method is compliant with NEPM (2013) Schedule B(3) (Method 301)
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Organic Matter	EP004	SOIL	In house: Referenced to AS1289.4.1.1 - 1997. Dichromate oxidation method after Walkley and Black. This method is compliant with NEPM (2013) Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270E Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270E. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260D. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270E Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260D Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001-PR	SOIL	In house: Referenced to Rayment and Higginson 4B1, 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM (2013) Schedule B(3) (Method 103)
Exchangeable Cations Preparation Method (Alkaline Soils)	ED006PR	SOIL	In house: Referenced to Rayment and Lyons 2011 method 15C1.
Exchangeable Cations Preparation Method	ED007PR	SOIL	In house: Referenced to Rayment & Higginson (1992) method 15A1. A 1M NH4Cl extraction by end over end tumbling at a ratio of 1:20. There is no pretreatment for soluble salts. Extracts can be run by ICP for cations.

Preparation Methods	Method	Matrix	Method Descriptions
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of reagent grade water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Organic Matter	EP004-PR	SOIL	In house: Referenced to AS1289.4.1.1 - 1997. Dichromate oxidation method after Walkley and Black. This method is compliant with NEPM (2013) Schedule B(3) (Method 105)
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample RINSATE (ALS #17) was not received.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

ALS Environmental

QUALITY CONTROL REPORT

Work Order	: **ES2025648**	Page	: 1 of 10
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 30-Jul-2020
Order number	: ----	Date Analysis Commenced	: 30-Jul-2020
C-O-C number	: ----	Issue Date	: 03-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 16		
No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Laboratory sample ID	Client sample ID	Method: Compound	CAS Number	Matrix Spike (MS) Report: Spike Concentration	SpikeRecovery(%): MS	Recovery Limits (%): Low	Recovery Limits (%): High
EG005(ED093)T: Total Metals by ICP-AES (QCLot: 3171354)

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2025648**	Page	: 1 of 8
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 30-Jul-2020
Site	: ----	Issue Date	: 03-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch	No. of samples received	: 16
Order number	: ----	No. of samples analysed	: 16

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Total Mercury by FIMS	1	20	5.00	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 6.1 and Table 1 (14 day holding time).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM 2013 with Confirmation of Identification by AS 4964 - 2004 Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270E Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270E. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260D. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- This is an updated SRN which indicates the new scheduled release date for this work order.
- **The final report will be completed by the scheduled reporting date listed in this SRN. A Preliminary report will be available on 10/08/20 (for Asbestos only) with the exception of the rest of analysis.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Mercury by FIMS : EG035F		
RINSATE 04/08/2020	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered

Dissolved Metals by ICP-MS - Suite A : EG020A-F		
RINSATE 04/08/2020	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered
RINSATE 05/08/2020	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

ES2026818-076 : [04-Aug-2020] : RINSATE - 04/08/2020
ES2026818-077 : [05-Aug-2020] : RINSATE - 05/08/2020

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

- EA200: N/A - Not Applicable

QUALITY CONTROL REPORT

Work Order	: **ES2026818**	Page	: 1 of 23
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 07-Aug-2020
Order number	: ----	Date Analysis Commenced	: 07-Aug-2020
C-O-C number	: 4	Issue Date	: 10-Aug-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 79		
No. of samples analysed	: 43		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

				Method Blank (MB) Report	Laboratory Control Spike (LCS) Report			
					Spike	Spike Recovery (%)	Recovery Limits (%)	
Method: Compound	CAS Number	LOR	Unit	Result	Concentration	LCS	Low	High
EG005(ED093)T: Total Metals by ICP-AES (QCLot: 3188100)

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2026818**	Page	: 1 of 16
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 07-Aug-2020
Site	: ----	Issue Date	: 10-Aug-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty	No. of samples received	: 79
Order number	: ----	No. of samples analysed	: 43

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP068B: Organophosphorus Pesticides (OP)	QC-3186811-002	----	**Monocrotophos**	6923-22-4	53.9 %	54.0-126%	**Recovery less than lower control limit**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Pesticides by GCMS	0	4	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	4	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Pesticides by GCMS	0	4	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	4	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

Dates

Date Samples Received	: 07-Aug-2020 08:30	Issue Date	: 07-Aug-2020
Client Requested Due Date	: 10-Aug-2020	Scheduled Reporting Date	: **11-Aug-2020**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: 3	Temperature	: 23.4' C - Ice Bricks present
Receipt Detail	:	No. of samples received / analysed	: 45 / 29

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **The final report will be completed by the scheduled reporting date listed in this SRN. A Preliminary report will be available on 10/08/20 (for Asbetos only) with the exception of the rest of analysis.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method / Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Mercury by FIMS : EG035F		
RINSATE	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
RINSATE	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 45		
No. of samples analysed	: 29		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- **EA200 Legend**
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

- EA200: N/A - Not Applicable

ALS Environmental

QUALITY CONTROL REPORT

Work Order	: **ES2026823**	Page	: 1 of 22
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 07-Aug-2020
Order number	: ----	Date Analysis Commenced	: 07-Aug-2020
C-O-C number	: ----	Issue Date	: 11-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 45		
No. of samples analysed	: 29		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**
