Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2026823**	Page	: 1 of 12
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 07-Aug-2020
Site	: ----	Issue Date	: 11-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch	No. of samples received	: 45
Order number	: ----	No. of samples analysed	: 29

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Pesticides by GCMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Pesticides by GCMS	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Asbestos Identification in Bulk Solids	EA200	SOLID	In house: Referenced to AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **ES2027007**	Page	: 1 of 15
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 11-Aug-2020 10:40
Order number	: ----	Date Analysis Commenced	: 11-Aug-2020
C-O-C number	: ----	Issue Date	: 12-Aug-2020 18:20
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 7		
No. of samples analysed	: 7		

ilac-MRA NATA

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005: Poor precision was obtained for Chromium on sample ES2027007-1. Results have been confirmed by re-extraction and re-analysis.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.

- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

QUALITY CONTROL REPORT

Work Order	: **ES2027007**	Page	: 1 of 12
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 11-Aug-2020
Order number	: ----	Date Analysis Commenced	: 11-Aug-2020
C-O-C number	: ----	Issue Date	: 12-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 7		
No. of samples analysed	: 7		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 11-Aug-2020
Site	: ----	Issue Date	: 12-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch	No. of samples received	: 7
Order number	: ----	No. of samples analysed	: 7

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	ES2027007--001	STP18-1	**Chromium**	7440-47-3	47.4 %	0% - 20%	**RPD exceeds LOR based limits**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Dissolved Mercury by FIMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Pesticides by GCMS	0	3	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	3	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Dissolved Metals by ICP-MS - Suite A	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
Pesticides by GCMS	0	3	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	3	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order	: **ES2027013**	Page	: 1 of 4
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 12-Aug-2020 08:30
Order number	: 680.10679	Date Analysis Commenced	: 13-Aug-2020
C-O-C number	: ----	Issue Date	: 14-Aug-2020 11:00
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 8		
No. of samples analysed	: 8		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2027013**	Page	: 1 of 4
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 12-Aug-2020
Site	: ----	Issue Date	: 14-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch	No. of samples received	: 8
Order number	: 680.10679	No. of samples analysed	: 8

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)		Sample Date	Extraction / Preparation			Analysis

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample V203 (ALS #48) was not received.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Mercury by FIMS : EG035F		
RINSATE	- Clear Plastic Bottle - Unfiltered; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
RINSATE	- Clear Plastic Bottle - Unfiltered; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 12-Aug-2020 08:58
Order number	: ----	Date Analysis Commenced	: 13-Aug-2020
C-O-C number	: ----	Issue Date	: 17-Aug-2020 15:39
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 62		
No. of samples analysed	: 39		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

QUALITY CONTROL REPORT

Work Order	: **ES2028010**	Page	: 1 of 20
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 12-Aug-2020
Order number	: ----	Date Analysis Commenced	: 13-Aug-2020
C-O-C number	: ----	Issue Date	: 17-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 62		
No. of samples analysed	: 39		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2028010**	Page	: 1 of 10
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 12-Aug-2020
Site	: ----	Issue Date	: 17-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch	No. of samples received	: 62
Order number	: ----	No. of samples analysed	: 39

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Dissolved Mercury by FIMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Pesticides by GCMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	4	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Pesticides by GCMS	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	4	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

CERTIFICATE OF ANALYSIS

Work Order	: **ES2028218**	Page	: 1 of 8
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 14-Aug-2020 08:00
Order number	: ----	Date Analysis Commenced	: 14-Aug-2020
C-O-C number	: ----	Issue Date	: 17-Aug-2020 15:41
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 3		
No. of samples analysed	: 3		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alexander Ristoski	Laboratory Technican	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

QUALITY CONTROL REPORT

Work Order	: **ES2028218**	Page	: 1 of 8
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 14-Aug-2020
Order number	: ----	Date Analysis Commenced	: 14-Aug-2020
C-O-C number	: ----	Issue Date	: 17-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 3		
No. of samples analysed	: 3		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alexander Ristoski	Laboratory Technican	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2028218**	Page	: 1 of 6
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 14-Aug-2020
Site	: ----	Issue Date	: 17-Aug-2020
Sampler	: Sarah Doherty/Gemma Sherridan/James Murdoch	No. of samples received	: 3
Order number	: ----	No. of samples analysed	: 3

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*	
Laboratory Duplicates (DUP)							
Moisture Content	EA055	1	6	**16.67**	**10.00**	✓	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Water samles RIN14 (#2) and RIN17 (#3) to be analysed for TPH C6-C9/BTEX and total metals as per containers supplied.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Analytical Results

QUALITY CONTROL REPORT

Work Order	: **ES2028221**	Page	: 1 of 13
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 18-Aug-2020
Order number	: ----	Date Analysis Commenced	: 18-Aug-2020
C-O-C number	: 2	Issue Date	: 20-Aug-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 20		
No. of samples analysed	: 20		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2028221**	Page	: 1 of 10
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 18-Aug-2020
Site	: ----	Issue Date	: 20-Aug-2020
Sampler	: GEMMA SHERIDAN, JAMES MURDOCH, Sarah Dorherty	No. of samples received	: 20
Order number	: ----	No. of samples analysed	: 20

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP080S: TPH(V)/BTEX Surrogates	ES2028221-010	STP20-1	**Toluene-D8**	2037-26-5	73.5 %	73.9-132 %	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL** Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **This is an updated SRN which indicates Asbestos for samples 1-7.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Order number	: ----	Date Analysis Commenced	: 04-Sep-2020
C-O-C number	: ----	Issue Date	: 08-Sep-2020
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 11		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2030598**	Page	: 1 of 8
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 04-Sep-2020
Site	: ----	Issue Date	: 08-Sep-2020
Sampler	: ROBIN BIRUA	No. of samples received	: 11
Order number	: ----	No. of samples analysed	: 11

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Workorder has been split into ES2032454 due to samples numbers.**
- **16/09/2020: This is an updated SRN which indicates Asbestos analysis for sample Val-100 (ALS #77), as per bag supplied.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **ES2032260**	Page	: 1 of 37
Amendment	: **1**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 15-Sep-2020 10:20
Order number	: ----	Date Analysis Commenced	: 15-Sep-2020
C-O-C number	: ----	Issue Date	: 21-Sep-2020 15:26
Sampler	: Robin Birua		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 76		
No. of samples analysed	: 39		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005: Poor precision was obtained for Chromium on sample ES2032260-1. Results have been confirmed by re-extraction and reanalysis
- Amendment (18/09/2020): This report has been amended and re-released to allow the reporting of additional analytical data.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

QUALITY CONTROL REPORT

Work Order	: **ES2032260**	Page	: 1 of 25
Amendment	: **1**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 15-Sep-2020
Order number	: ----	Date Analysis Commenced	: 15-Sep-2020
C-O-C number	: ----	Issue Date	: 21-Sep-2020
Sampler	: Robin Birua		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 76		
No. of samples analysed	: 39		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2032260**	Page	: 1 of 13
Amendment	: **1**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 15-Sep-2020
Site	: ----	Issue Date	: 21-Sep-2020
Sampler	: Robin Birua	No. of samples received	: 76
Order number	: ----	No. of samples analysed	: 39

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	ES2032260--001	Val-56	**Chromium**	7440-47-3	30.7 %	0% - 20%	**RPD exceeds LOR based limits**
Matrix Spike (MS) Recoveries							
EG005(ED093)T: Total Metals by ICP-AES	ES2032260--077	Val-100	**Chromium**	7440-47-3	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Hi Angus/Helen,

Thanks for sending me through the photos of soil jars and bags.

The darker reddish brown coloured soil bags and jars belong to stockpile STP30 1 to 5. If you are looking at the photos Helen sent us this arvo that will give you a clear idea of colour difference.

Photos 2 – the bag in the middle and the soil jar on the left hand side belongs to STP31-01.
Photos 3 – the soil jar and the bag on the top belong to STP31-02
Photos 5 – the soil jar and the bag on the top belong to STP31-03.
Please give me a call if you have any questions.
Kind regards,

SLR

Robin Birua
Project Consultant - Land Quality & Remediation

Please note in response to the COVID 19 Pandemic and physical distancing recommendations from the Australian Government,
SLR is encouraging staff to work remotely and implement flexible working hours if necessary.
If you have received this email outside of regular office hours, it is not expected that you will respond until your own working hours commence.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- This is an updated SRN which indicates the addition of tests to samples 026-028 and 031-033 for this work order.
- **Samples QC-27 and QC-28 not received. Samples 38-45 received extra. Extra soil bag received for sample 26; no soil bag received for sample 31. Duplicate jar and bag received for samples 27-28; samples 32-33 not received.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **ES2032265**	Page	: 1 of 35
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 14-Sep-2020 09:30
Order number	: ----	Date Analysis Commenced	: 16-Sep-2020
C-O-C number	: ----	Issue Date	: 21-Sep-2020 15:30
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 43		
No. of samples analysed	: 34		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

QUALITY CONTROL REPORT

Work Order	: **ES2032265**	Page	: 1 of 27
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 14-Sep-2020
Order number	: ----	Date Analysis Commenced	: 16-Sep-2020
C-O-C number	: ----	Issue Date	: 21-Sep-2020
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 43		
No. of samples analysed	: 34		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2032265**	Page	: 1 of 14
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 14-Sep-2020
Site	: ----	Issue Date	: 21-Sep-2020
Sampler	: ROBIN BIRUA	No. of samples received	: 43
Order number	: ----	No. of samples analysed	: 34

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Pesticides by GCMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	7	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Pesticides by GCMS	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	7	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Workorder has been split into ES2032260 due to samples numbers.**
- **Samples #37, #55 - 59 were not received.**
- **Water samples #60 - 63 to be analysed for metals only as per bottles supplied.**
- **16/09/2020: This is an updated SRN which indicates the analyis for trip blanks be cancelled.**
- **18/09/2020: This is an updated SRN which indicates sample #38 received and re-number as #73 for Asbestos.**
- **18/09/2020: This is an updated SRN which indicates the analysis for samples #66-70.**
- **(21/09/2020) This is an updated SRN which reflects a change in ID for sample 066-070.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

ES2032454-064 : [10-Sep-2020] : TB01 - Received as TP01
ES2032454-065 : [11-Sep-2020] : TB02 - Received as TP02

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

QUALITY CONTROL REPORT

Work Order	: **ES2032454**	Page	: 1 of 26
Amendment	: **1**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 15-Sep-2020
Order number	: ----	Date Analysis Commenced	: 15-Sep-2020
C-O-C number	: ----	Issue Date	: 21-Sep-2020
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 66		
No. of samples analysed	: 36		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2032454**	Page	: 1 of 12
Amendment	: **1**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 15-Sep-2020
Site	: ----	Issue Date	: 21-Sep-2020
Sampler	: ROBIN BIRUA	No. of samples received	: 66
Order number	: ----	No. of samples analysed	: 36

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).

Preparation Methods	Method	Matrix	Method Descriptions

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- Amendment (21/09/2020): This report has been amended to allow a change in ID for samples 066-070. All analysis results are as per the previous report.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Hi Adrian,
Please ignore the analysis of trip blanks from all three COCs. I was notified that we do not submit separate trip blanks.
Thanks heaves.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Samples #51 - 54 were not received.**
- **Samples #55 - 65 received extra, placed on hold**
- **18/09/2020: This is an updated SRN which indicates analysis for samples #60 - #62 and removed samples #55-#59 to ES2032454, sample #63 to ES2032260.**
- **18/09/2020: This is an updated SRN which indicates analyis for samples 60-62.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

CERTIFICATE OF ANALYSIS

Work Order	: **ES2032486**	Page	: 1 of 49
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 15-Sep-2020 10:20
Order number	: ----	Date Analysis Commenced	: 16-Sep-2020
C-O-C number	: ----	Issue Date	: 21-Sep-2020 17:44
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 55		
No. of samples analysed	: 53		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Christopher Owler	Team Leader - Asbestos	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005: Poor precision was obtained for Chromium on sample ES2032486-11 Results have been confirmed by re-extraction and reanalysis.
- EP068: Positive result has been confirmed by re-extraction and re-analysis.
- EG005: Poor precision was obtained for Chromium on sample ES2032486-41. Results have been confirmed by re-extraction and re-analysis.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

No. of samples analysed	: 53		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2032486**	Page	: 1 of 14
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 15-Sep-2020
Site	: ----	Issue Date	: 21-Sep-2020
Sampler	: ROBIN BIRUA	No. of samples received	: 55
Order number	: ----	No. of samples analysed	: 53

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	ES2032486--041	Val-T-41	**Chromium**	7440-47-3	21.2 %	0% - 20%	**RPD exceeds LOR based limits**
EG005(ED093)T: Total Metals by ICP-AES	ES2032486--011	Val-T-11	**Chromium**	7440-47-3	52.0 %	0% - 20%	**RPD exceeds LOR based limits**
Matrix Spike (MS) Recoveries							
EG005(ED093)T: Total Metals by ICP-AES	ES2032260--077	Anonymous	**Chromium**	7440-47-3	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

Laboratory sample ID	Client sampling date / time	Client sample ID	SOIL - EA200G Asbestos Identification in Soils -

No. of samples analysed	: 3		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Amendment 23/09/2020: This report has been amended and re-released to allow for amendments to sample IDs as per Robin Birua. All analysis results are as per the previous report.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2032556**	Page	: 1 of 4
Amendment	: **2**		
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 21-Sep-2020
Site	: ----	Issue Date	: 23-Sep-2020
Sampler	: ROBIN BIRUA	No. of samples received	: 3
Order number	: ----	No. of samples analysed	: 3

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis		
		Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation
EA200: AS 4964 - 2004 Identification of Asbestos in Soils							
Snap Lock Bag - ACM/Asbestos Grab Bag (EA200)							
Val-94-2, Val-94-1, Val-94-3	**18-Sep-2020**	**----**	----	----	**22-Sep-2020**	17-Mar-2021	✓

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Client sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Mercury by FIMS : EG035F		
Rinsate	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
Rinsate	- Clear Plastic Bottle - Unspecified; Lab-acidified	- Clear Plastic Bottle - Nitric Acid; Filtered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **ES2033114**	Page	: 1 of 15
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 22-Sep-2020 09:00
Order number	: ----	Date Analysis Commenced	: 22-Sep-2020
C-O-C number	: 1	Issue Date	: 23-Sep-2020 17:29
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 8		
No. of samples analysed	: 8		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005: Poor precision was obtained for Chromium on sample ES2033114-1. Results were confirmed by re-extraction and re-analysis.
- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.

- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 22-Sep-2020
Order number	: ----	Date Analysis Commenced	: 22-Sep-2020
C-O-C number	: 1	Issue Date	: 23-Sep-2020
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 8		
No. of samples analysed	: 8		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2033114**	Page	: 1 of 9
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 22-Sep-2020
Site	: ----	Issue Date	: 23-Sep-2020
Sampler	: ROBIN BIRUA	No. of samples received	: 8
Order number	: ----	No. of samples analysed	: 8

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	ES2033114--001	STP32-01	**Chromium**	7440-47-3	38.5 %	0% - 20%	**RPD exceeds LOR based limits**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Dissolved Mercury by FIMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Pesticides by GCMS	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	1	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Dissolved Metals by ICP-MS - Suite A	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
Pesticides by GCMS	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Moisture Content	EA055	1	7	14.29	10.00	✓	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Asbestos analysis will be conducted by ALS Newcastle.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **ES2033117**	Page	: 1 of 3
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: Sarah Dorherty	Contact	: Tyler Anderson
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.10679 John Stokes Square	Date Samples Received	: 22-Sep-2020 09:00
Order number	: ----	Date Analysis Commenced	: 23-Sep-2020
C-O-C number	: 1	Issue Date	: 23-Sep-2020 10:52
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: SY/333/20 V2		
No. of samples received	: 3		
No. of samples analysed	: 3		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2033117**	Page	: 1 of 4

Order number	: ----	No. of samples analysed	: 3

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis		
		Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining

Dear James,

Re: Asbestos Identification Analysis - John Stokes Square, 47 Progress Drive, Nightcliff NT 0810

This letter presents the results of asbestos fibre identification analysis performed on 6 samples as received by Greencap on Wednesday, 29 July 2020. The samples were stated to be from John Stokes Square, 47 Progress Drive, Nightcliff NT 0810.

All sample analysis was performed using polarised light microscopy, including dispersion staining in our Darwin Laboratory by the method of Australian Standard AS4964-2004 and supplementary work instruction in house method LAB04 Asbestos Identification by PLM. Any and all services carried out by Greencap for the Client are subject to the Terms and Conditions listed on the Greencap website at https://www.greencap.com.au/terms-conditions and are governed by our statements of limitation available at https://www.greencap.com.au/statements-limitation .

The analysis was completed on Wednesday, 29 July 2020.

The samples will be kept for three months and then disposed of, unless otherwise directed.

The results of the asbestos identification analysis are presented in the appended table. Accreditation covers testing activities only, sampling activity is outside the scope of ISO 17025 accreditation. Results relate only to the items tested and are for the sole use by the client.

Should you require further information please contact Darren Kenny .

Yours sincerely,
Greencap

* Shaded row with bolded text indicates sample contains a positive Analysis Result for asbestos.
If Synthetic Mineral Fibre and Organic Fibre are not stated in Analysis Results, it implies not detected.

PLEASE NOTE The samples in this report are 'As Received'. Greencap does not take responsibility for the sampling procedure or accuracy of the sample location descriptions which have been provided by the client.

NOTE 1 The reporting limit for this analysis is 0.1g/kg (0.01%) by application of polarised light microscopy, dispersion staining and trace analysis techniques. The above result can be interpreted that the sample contains no detectable 'respirable' asbestos fibres (AS4964-2004 Clause 9.5).

NOTE 2 Due to the size of the sample submitted, Greencap has undertaken sub-sampling of the <2 mm fraction to reduce the sample size to approximately 30-60 g, as per AS4964, clause 8.2.3. The process of sub-sampling followed ISO 3082 (2000 (E)) Part 10.4.2.4 “The manual increment division method”. Due to the non-homogenous nature of the sample sub-sampling may not be fully representative of the initial sample. This is a NATA required disclaimer.

NOTE 3 Soil analysis conducted in accordance with WA Guidelines for the assessment, remediation and management of asbestos-contaminated sites (May 2009), Recommended procedures for laboratory analysis of asbestos in soil (June 2011) and NEPM Schedule B1: Guideline on investigation levels for soil & groundwater, Schedule B2: Guideline on site characterisation.

NOTE 4 Trace analysis has been performed and the above result can be interpreted that the sample contains no detectable 'respirable' asbestos fibres (AS4964-2004 Clause 9.5).

Dear Sarah,

Re: Asbestos Identification Analysis - John Stokes Square, 47 Progress Drive, Nightcliff NT 0810

This letter presents the results of asbestos fibre identification analysis performed on 57 samples as received by Greencap on Tuesday, 18 August 2020. The samples were stated to be from John Stokes Square, 47 Progress Drive, Nightcliff NT 0810.

All sample analysis was performed using polarised light microscopy, including dispersion staining in our Darwin Laboratory. Any and all services carried out by Greencap for the Client are subject to the Terms and Conditions listed on the Greencap website at https://www.greencap.com.au/terms-conditions and are governed by our statements of limitation available at https://www.greencap.com.au/statements-limitation.

The analysis was completed on Thursday, 20 August 2020.

The samples will be kept for three months and then disposed of, unless otherwise directed.

The results of the asbestos identification analysis are presented in the appended table."Results relate only to the items tested and are for the sole use by the client.

Should you require further information please contact Darren Kenny.

Yours sincerely,
Greencap

Dear Sarah,

Re: Asbestos Identification Analysis - John Stokes Square, 47 Progress Drive, Nightcliff NT 0810

This letter presents the results of asbestos fibre identification analysis performed on 12 samples as received by Greencap on Tuesday, 18 August 2020. The samples were stated to be from John Stokes Square, 47 Progress Drive, Nightcliff NT 0810.

All sample analysis was performed using polarised light microscopy, including dispersion staining in our Darwin Laboratory by the method of Australian Standard AS4964-2004 and supplementary work instruction in house method LAB04 Asbestos Identification by PLM. Any and all services carried out by Greencap for the Client are subject to the Terms and Conditions listed on the Greencap website at https://www.greencap.com.au/terms-conditions and are governed by our statements of limitation available at https://www.greencap.com.au/statements-limitation .

The analysis was completed on Friday, 21 August 2020.

The samples will be kept for three months and then disposed of, unless otherwise directed.

The results of the asbestos identification analysis are presented in the appended table. Accreditation covers testing activities only, sampling activity is outside the scope of ISO 17025 accreditation. Results relate only to the items tested and are for the sole use by the client.

Should you require further information please contact Darren Kenny.

Yours sincerely,
Greencap

* Shaded row with bolded text indicates sample contains a positive Analysis Result for asbestos.

If Synthetic Mineral Fibre and Organic Fibre are not stated in Analysis Results, it implies not detected.

PLEASE NOTE The samples in this report are 'As Received'. Greencap does not take responsibility for the sampling procedure or accuracy of the sample location descriptions which have been provided by the client.

NOTE 1 The reporting limit for this analysis is 0.1g/kg (0.01%) by application of polarised light microscopy, dispersion staining and trace analysis techniques. The above result can be interpreted that the sample contains no detectable 'respirable' asbestos fibres (AS4964-2004 Clause 9.5).

NOTE 2 Due to the size of the sample submitted, Greencap has undertaken sub-sampling of the <2 mm fraction to reduce the sample size to approximately 30-60 g, as per AS4964, clause 8.2.3. The process of sub-sampling followed ISO 3082 (2000 (E)) Part 10.4.2.4 “The manual increment division method”. Due to the non-homogenous nature of the sample sub-sampling may not be fully representative of the initial sample. This is a NATA required disclaimer.

NOTE 3 Soil analysis conducted in accordance with WA Guidelines for the assessment, remediation and management of asbestos-contaminated sites (May 2009), Recommended procedures for laboratory analysis of asbestos in soil (June 2011) and NEPM Schedule B1: Guideline on investigation levels for soil & groundwater, Schedule B2: Guideline on site characterisation.

Accreditation covers testing activities only, sampling activity is outside the scope of ISO 17025 accreditation. Results relate only to the items tested and are for the sole use by the client. Please note this report replaces the previous version issued on Thursday, 27 August 2020 . Amendments were made to sample numbers 003, 004, 010 & 012. Several errors have been corrected. Samples 003, 004, 005, 006, 009, 010 & 012 contain asbestos fibres however the quantity is below the reporting limit of 0.1g/kg for the AS4964 test method.

Should you require further information please contact Darren Kenny.

Yours sincerely,
Greencap

This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025 - Testing.
Accreditation No. 5450, Site No. 24550 Darwin Laboratory.
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/National standards.

Sampling was not conducted by Greencap and is therefore outside the scope of our NATA accreditation.

Report Date: Wednesday, 16/09/2020 Our ref: C110151:NT84933 - V2

Site Location:	John Stokes Square, 47 Progress Drive, Nightcliff NT 0810		
	Sample ID	Sample Location/Description/Weight or Size	Analysis Result
1	NT84933 - 001	As Received - "STP16B-1b" Brown soil, stones and rocks, one fibre cement sheet fragment containing Chrysotile and Amosite asbestos(>2mm fraction), one fibre cement fragment containing Chrysotile asbestos (<2mm fraction), three discrete Chrysotile asbestos bundles and one discrete Amosite asbestos bundle (<2mm fraction) one discrete SMF bundle, plastic fragments, glass fragments, charcoal and organic material. Total approximate mass of 0.09 grams of Chrysotile and 0.05 grams of Amosite. ~ 598.62g	Chrysotile (white asbestos) Amosite (brown asbestos) Organic Fibres Synthetic Mineral Fibres See NOTE 1 & 2
2	NT84933 - 002	As Received - "STP16B-2b" Brown soil, stones and rocks, charcoal & organic material ~ 617.70g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
3	NT84933 - 003	As Received - "STP16B-3b" Brown soil stones and rocks, seven discrete Chrysotile asbestos bundles and three discrete Amosite asbestos fibre bundles (<2mm fraction), charcoal and organic material. Total approximate mass of 0.01 grams of Chrysotile and 1927.2 micrograms of Amosite. ~ 578.33g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
4	NT84933 - 004	As Received - "STP16B-4b" Brown soil, stones and rocks, three discrete Chrysotile asbestos bundles and one cement sheet fragment, paint flakes, charcoal and organic material. Total approximate mass of 0.01 grams of Chrysotile. ~ 617.66g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
5	NT84933 - 005	As Received - "STP16B-5b" Brown soil, stones and rocks, one discrete Chrysotile asbestos bundle, one discrete mineral fibre of unknown type bundle, paint flakes, charcoal and organic material. Total approximate mass of 203.1 micrograms of Chrysotile. ~ 589.83g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
6	NT84933 - 006	As Received - "STP16B-6b" Brown soil, stones and rocks, four discrete Chrysotile asbestos bundles, one discrete mineral fibre of unknown type bundle, aluminium foil fragment, paint flakes, charcoal and organic material. Total approximate mass of 2855.6 micrograms of Chrysotile. ~ 595.53g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
7	NT84933 - 007	As Received - "STP21B-1b" Red brown soil, stones and rocks, charcoal and organic material ~ 583.41g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2

Report Date: Wednesday, 16/09/2020 Our ref: C110151:NT84933 - V2

Site Location:	John Stokes Square, 47 Progress Drive, Nightcliff NT 0810		
	Sample ID	Sample Location/Description/Weight or Size	Analysis Result
8	NT84933 - 008	As Received - "STP21B-2b" Red brown soil, stones and rocks, charcoal and organic material ~ 531.78g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
9	NT84933 - 009	As Received - "STP21B-3b" Red brown soil, stones and rocks, six discrete Chrysotile asbestos bundles (<2mm fraction), one discrete Amosite asbestos bundle (<2mm fraction), charcoal and organic material. Total approximate mass of 2841.6 micrograms of Chrysotile and 105.0 micrograms of Amosite. ~ 522.03g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
10	NT84933 - 010	As Received - "STP21B-4b" Red brown soil, stones and rocks, three discrete Chrysotile asbestos bundles (<2mm fraction), one discrete SMF bundle, charcoal and organic material. Total approximate mass of 1851.3 micrograms of Chrysotile. ~ 600.32g	No Asbestos Detected At or Above Reporting Limit Organic Fibres Synthetic Mineral Fibres See NOTE 1 & 2
11	NT84933 - 011	As Received - "STP21B-5b" Red brown soil, stones and rocks, charcoal and organic material. ~ 588.07g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2
12	NT84933 - 012	As Received - "STP21B-6b" Red brown soil, stones and rocks, One discrete Chroysotile asbestos bundle (<2mm fraction), one discrete Amosite asbestos bundle (<2mm fraction), charcoal and organic material. Total approximate mass of 877.5 micrograms of Chrysotile and 437.5 micrograms of Amosite. ~ 601.14g	No Asbestos Detected At or Above Reporting Limit Organic Fibres See NOTE 1 & 2

* Shaded row with bolded text indicates sample contains a positive Analysis Result for asbestos.
If Synthetic Mineral Fibre and Organic Fibre are not stated in Analysis Results, it implies not detected.

PLEASE NOTE The samples in this report are 'As Received'. Greencap does not take responsibility for the sampling procedure or accuracy of the sample location descriptions which have been provided by the client.

NOTE 1 The reporting limit for this analysis is 0.1g/kg (0.01%) by application of polarised light microscopy, dispersion staining and trace analysis techniques. The above result can be interpreted that the sample contains no detectable 'respirable' asbestos fibres (AS4964-2004 Clause 9.5).

NOTE 2 Soil analysis conducted in accordance with WA Guidelines for the assessment, remediation and management of asbestos-contaminated sites (May 2009), Recommended procedures for laboratory analysis of asbestos in soil (June 2011) and NEPM Schedule B1: Guideline on investigation levels for soil & groundwater, Schedule B2: Guideline on site characterisation.

EXECUTIVE SUMMARY

The Department of Infrastructure, Planning and Logistics (DIPL), through Project Management Consultants HK Solutions Pty Ltd, have engaged SLR Consulting Australia Pty Ltd (SLR) to provide environmental consultancy services relating to the redevelopment of John Stokes Square, located at 47 Progress Drive, Nightcliff, Darwin, Northern Territory (NT) (herein referred to as the "Project Area").

The Project Area is planned to be subdivided as part of the redevelopment project, with varying land use classifications including high density residential, public open space, community and commercial. Works were undertaken across the Project Area to characterise, remediate and validate the newly defined land parcels to ensure suitability for the proposed land uses.

This addendum report outlines the remediation and validation works that were undertaken for the sewer easement located along the eastern and southern boundaries of the proposed residential allotments defined as Lot B2 (3,453 m^2) and Lot B3 (3,455m^2) (herein referred to as the "Site").

This addendum report has been prepared for endorsement by the appointed Auditor (as defined in Part 9 of the *Waste Management Pollution Control Act, 1998*) for the Site – Jean-Paul Pearce (Australian Environmental Auditor, "the Auditor") and in accordance with the *"Northern Territory Contaminated Land Guideline"*, NT Environmental Protection Authority (EPA), June 2017, Version 1.0. The main role of the Auditor is to evaluate the environmental conditions of the Site at the date of signing the certificate of statement and to form an opinion, on which others can rely upon, regarding the suitability of the Site for future land uses. In doing so, the Auditor is required to review the environmental site assessments and validation works undertaken by environmental consultants in relation to site contamination to confirm the remediation objectives have been met prior to redevelopment of the Site.

The remediation works undertaken within the larger portion of the Site were conducted in accordance with the strategy outlined in the Auditor endorsed memorandum titled "*Remediation Strategy - John Stokes Square - Residential Lots (Lots B1, B2 and B3)"*(ref: 680.10679.00000-M04-v2.0). Remediation works conducted involved the following key activities.

- Stripping and excavating uncontrolled fill material to apparent natural soil conditions (either weathered rock or rock) across the Site. Spoil material and resultant excavation were inspected for evidence of any asbestos containing material (ACM) or other contaminants of potential concern (COPC). Based on visual observations, potentially impacted spoil was progressively segregated and stockpiled separately from non-impacted spoil.
- Removal of abandoned underground services including stormwater pipes, sewer pipes, electrical cables and pipes, communication cables, water supply network including irrigation and fire hydrant pipes, and visually inspecting the services, spoil, and resultant excavations for evidence of ACM or other COPC. Based on visual observations, potentially impacted spoil and services constructed out of ACM were progressively segregated and stockpiled separately from non-impacted spoil.
- Visually inspecting the surfaces of, and collecting validation samples from, the remediated areas of the Site (i.e. resultant excavations/trenches). Collated details of the areas remediated including the extent and depth of excavation, validation sample locations, sample identification numbers, date sampled and photographic logs. Submitting validation samples to be analysed by a NATA accredited laboratory.

- Inspected excavated spoil throughout the screening process for visual evidence of ACM contamination. The earthworks contractor screened geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble from the stockpiled spoil. The screened spoil was placed into smaller stockpiles and sampled by SLR's environmental consultant for characterisation purposes to inform either beneficial reuse onsite or offsite disposal. In the majority of cases stockpile material was not mixed with other stockpiled material until laboratory result were received, the material classified, and advice provided on appropriate reuse or disposal options.
- Asbestos impacted stockpiles were removed from the Site by a licenced asbestos removal contractor for appropriate offsite disposal. SLR's environmental consultant visually inspected and collected validation samples of the surface areas where asbestos material was stored for the purpose of confirming that all ACM had been adequately removed.
- Excavated areas on Lots B1, B2 and B3 were reinstated using spoil material that had been characterised as being suitable for reuse onsite. Spoil was reinstated in approximately 200 mm thick lifts. SLR's environmental consultant visually inspected each lift for the purpose of providing ACM clearance certificates.

Remediation and validation work conducted within the wider portion of the Site are detailed in the report titled *"Validation Report, John Stokes Square Redevelopment, Proposed Residential Lots B1, B2 and B3*" (SLR reference: 680.10679.00100-R05, "SLR VAL 2021") and is to be read in conjunction with this addendum report.

A "live" sewer main is located along the eastern boundaries of both Lots B2 and B3, and along the southern boundary of Lot B2. Remediation works within 3m of these boundaries were limited due to the presence of this underground service and potential destabilisation of neighbouring fences, retaining walls and structures (e.g., sheds). Remediation works conducted in this area included some topsoil stripping (to a maximum depth of 0.3 m below ground surface) and targeted removal of soil where asbestos impact was visually determined (e.g., around the sewer riser).

Contractors conducting works associated with the removal/upgrade of these "live" services were advised to employ precautionary measures such as having safe work method statements and/or work-specific management plans addressing exposure to potentially asbestos impacted soils, unexpected finds protocol and associated training, to ensure workers understood the controls required to be implemented in the unlikely event unexpected asbestos was encountered.

This report outlines the results of the remediation and validation works that were overseen by SLR that were associated with the removal of shallow fill material and services made from ACM, during the upgrade of the sewer main along the eastern and southern boundaries of the Site. The remediation works were completed in two phases, details of which are provided below.

- The first phase of the works involved the removal of the shallow fill material within the sewer easement located along the eastern and southern boundaries of the Site. This fill material and any associated ACM debris were placed directly into skip bins and removed under asbestos conditions for appropriate offsite disposal by a Class A licenced asbestos removal contractor. The final extent of the area excavated was guided by visual assessments undertaken by a suitably qualified Environmental Consultant and supported by analytical results received for validation samples collected from the base and walls of the excavation.

- The second phase of the works involved overseeing the removal of the deeper reworked natural soil material and bedding sands used to backfill the sewer during its original installation, and the removal of sewer related infrastructure (i.e. pipes, risers) constructed with ACM. Following the completion of the excavation and removal of the sewer, the resultant excavation's surfaces (bases and walls) were visually inspected by a suitably qualified Environmental Consultant for the presence of asbestos debris. Validation samples were not collected from the base and walls of the resultant excavation associated with the second phase of the remediation works as:
  - the resultant trench extended into the Site's red natural soils;
  - ACM pipe and debris fragments encountered were bonded; and
  - the method of removal minimised the "breaking" of the ACM services
- Spoil removed during the second phase of the works were inspected for the presence of asbestos contamination during its removal and reinspected when stockpiled adjacent to the trench. If visual observations found ACM debris, then the debris and surrounding spoil were transported to the lined skip bins for appropriate offsite disposal by a licenced asbestos removal contractor.
- Imported soil material was used to backfill the resultant excavation within the sewer easement. SLR were engaged to characterise the imported soil material to ensure its quality from a contaminated land perspective to ensure that the imported soils met the remediation objectives for the Site.

Based on the field observations and analytical results obtained for the remediation and validation activities conducted at the Site by SLR, SLR considers that the proposed residential allotments Lots B1, B2 and B3 have been suitably remediated and validated for the proposed high density residential land use, subject to the considerations outlined in this addendum report and the main validation report (SLR, VAL 2021).

1 Introduction

The Department of Infrastructure, Planning and Logistics (DIPL), through Project Management Consultants HK Solutions Pty Ltd and Principal Contractor Halikos Pty Ltd (Halikos), have engaged SLR Consulting Australia Pty Ltd (SLR) to provide environmental consultancy services relating to the redevelopment of John Stokes Square, located at 47 Progress Drive, Nightcliff, Darwin, Northern Territory (NT) (herein referred to as the "Project Area"). The location of the Project Area is shown in **Figure 1 (Appendix A)**.

The Project Area is planned to be subdivided as part of the redevelopment project, with varying land use classifications as shown in **Figure 2 (Appendix A)**. Works were undertaken to characterise, remediate and validate the newly defined land parcels to ensure suitability for the intended proposed land use.

This addendum report outlines the remediation and validation works that were undertaken for the sewer easement located along the eastern and southern boundaries of the proposed residential allotments defined as Lots B2 and B3 (herein referred to as the "Site"). The aforementioned land parcels are being redeveloped for high density residential land use.

This addendum report has been prepared for endorsement by the appointed Auditor (as defined in Part 9 of the *Waste Management Pollution Control Act, 1998*) for the Site – Jean-Paul Pearce (Australian Environmental Auditor, "the Auditor") and in accordance with the *"Northern Territory Contaminated Land Guideline"*, NT Environmental Protection Authority (EPA), June 2017, Version 1.0. The main role of the Auditor is to evaluate the environmental conditions of the Site at the date of signing the certificate of statement and to form an opinion, on which others can rely upon, regarding the suitability of the Site for future land uses. In doing so, the Auditor is required to review the outcome of environmental site assessments and validation works undertaken by environmental consultants in relation to site contamination to confirm the remediation objectives have been met prior to redevelopment of the Site.

The remediation and validation work undertaken within the larger portion of the proposed residential allotments were conducted in general accordance with the strategy presented in the Auditor endorsed memorandum: *Remediation Strategy - John Stokes Square - Residential Lots (Lots B1, B2 and B3), ref:680.10679.00000-M04-v2.0*. The results of the remediation and validation works conducted within the wider portion of the Site is detailed in the report titled *"Validation Report, John Stokes Square Redevelopment, Proposed Residential Lots B1, B2 and B3*" (SLR reference: 680.10679.00100-R05, "SLR VAL 2021") and is to be read in conjunction with this report.

Results of the remediation and validation works undertaken within other areas of the Project Area are included under separate cover in the reports titled *"Validation Assessment, John Stokes Square Redevelopment, Lot A"* (SLR ref: 680.10679.00100-R02), and *"Validation Report, John Stokes Square Redevelopment, Road Reserve and Lot C"* (SLR ref: 680.10679.00100-R06).

1.1 Objectives

The purpose of this report is to document the remediation and validation works undertaken within the sewer easement located along the eastern and southern boundaries of the Site.

Even though all known asbestos impact had been removed from the Site (SLR VAL 2021), remediation works undertaken within the larger portion of the Site did not extend into the deeper fill material surrounding the "live" sewer mains that were present at the time of the initial remediation works. Contractors conducting works associated with the removal/upgrade of these "live" services were advised to employ precautionary measures such as having safe work method statements and/or work-specific management plans addressing exposure to potentially asbestos impacted soils, unexpected finds protocol and associated training, to ensure workers understood the controls required to be implemented in the unlikely event unexpected asbestos was encountered.

This report outlines the results of the remediation and validation works, that were overseen by SLR, associated with the removal of shallow fill material and services made from asbestos containing material (ACM) during the upgrade/replacement of the sewer main along the eastern and southern boundaries of the Site. Remediation works were undertaken to ensure the Site was suitable for its intended land use – high density residential.

1.2 Scope of Work

The following scope of work was undertaken by a suitably qualified and experienced SLR environmental consultant to meet the objectives of the remediation strategy developed for the Site -

- Oversaw the removal of uncontrolled fill material within the sewer easement located along the eastern and southern boundaries of the Site.
- Oversaw the removal of sewer pipes, risers, vents and manholes, and visually inspected the services, spoil, and resultant excavations for evidence of ACM.
- Visually inspected and collected validation samples of the remediated areas of the Site (i.e., resultant excavation/trench). Collated details of the areas remediated including the extent and depth of excavation, validation sample locations, sample identification labels, date sampled and photographic logs.
- Oversaw the removal of ACM and soil impacted with asbestos from the Site by licenced asbestos waste removal contractors for appropriate offsite disposal.
- Samples were collected and analysed for asbestos (presence/absence and/or asbestos fines (AF)/fibrous asbestos (FA)) at a National Association of Testing Authorities (NATA) accredited laboratory.
- Comparison of analytical results with relevant investigation levels (ILs) as prescribed in the remediation strategy.
- Air quality monitoring for the presence of air borne asbestos fibres was conducted during all remediation works undertaken at the Site.
- Collection of soil samples to determine the contamination status of fill material proposed to be brought onto the Site to backfill the resultant excavation within the sewer easement.

- Collation of all field notes, photographic logs, certified laboratory reports, location of underground services, asbestos clearance certificates, waste disposal documentation and air quality monitoring results.
- Preparation of this addendum validation report documenting all remediation and validation works undertaken at the Site.

1.3 Legislative Framework

The soil remediation and validation works were undertaken in accordance with the following regulatory requirements.

- ASC NEPM 2013, "National Environmental Protection (Assessment of Site Contamination) Measures 1999", (as amended on 16 May 2013).
- Western Australian (WA) Department of Health (DOH) 2009, "Guideline for the Assessment, Remediation and Management of Asbestos - Contaminated Sites in Western Australia".
- Standards Australia AS 4482.1-2005, "Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil. Part 1 Non-volatile and semi volatile compounds".
- New South Wales (NSW) Environmental Protection Authority (EPA) 2014, "Resource Recovery Order under Part 9, Clause 93 of the protection of the Environment Operations (Waste) Regulation 2014- the excavated natural material order 2014".
- NSW EPA 2014b, "Waste Classification Guidelines, Part 1: Classifying Waste".
- NT EPA 2017, "Northern Territory Contaminated Land Guidelines".
- NT EPA 2016, "Waste Management and Pollution Control Act".
- Safe Work Australia 2020, "How to manage and control asbestos in the workplace Code of Practice".

2 Background Information

2.1 Site Identification

A summary of the Site identification information is detailed in **Table 1**. Refer to **Figure 1 (Appendix A)** for a plan of the locality surrounding the Project Area and **Figure 2 (Appendix A)** for the extent and boundary definition of the Site (i.e., Lots B1, B2 and B3 areas).

The planned redevelopment of the Project Area will comprise of high-density residential buildings within Lots B1, B2 and B3, a police station within Lot A, and roadways and public open space within the Road Reserve and Lot C. Construction of new and upgraded land servicing infrastructure will be delivered as part of the redevelopment project.

Table 1 Site Information Details

Site information	Details
Site Owner	Northern Territory Government, Department of Local Government Housing and Community Development
Site Address	47 Progress Drive Nightcliff, Darwin, NT
Parcel Reference	Prior to subdivision, Lot 9077 Town of Nightcliff
Project Area Extent (approximate)	18,900 m^2
Lot B1 Area	2077 m^2
Lot B2 Area	3453 m^2
Lot B3 Area	3455 m^2
Current Occupier	DIPL
Current Land Use	Currently unoccupied, under redevelopment
Future Land Use	Police Station (Lot A), High Density Residential (Lots B1, B2 and B3), Road Reserve, Parking and Public Open Space (Lot C)
Current Zoning	Rezoned from Medium Density Residential to Specific Use Zone to facilitate the redevelopment of the broader Project Area for a mix of commercial, community, residential and public open space purposes.
Central GPS Coordinates (latitude and longitude)	-12.388 828°, 130.851 451°

2.2 Surrounding Environment

Additional information regarding surrounding land uses and activities, regional geology, regional topography, registered ground water bore information and acid sulphate soils have been outlined in the in the SLR report titled *"Validation Report, John Stokes Square Redevelopment, Proposed Residential Lots B1, B2 and B3*" (SLR VAL 2021).

2.3 Previous Environmental Investigations

SLR understands that DIPL commenced demolition of former public housing buildings in mid-2019, which were distributed across the wider Project Area. Majority of demolition wastes from the Site were removed and a portion of crushed concrete rubble was screened and spread across the Site as general fill. The EPA raised concerns that pesticides may have been historically used under the building's foundations, and that ACM contaminated fill material may have been historically imported to the Site. As such, the first limited site investigation was undertaken by Greencap Pty Ltd (Greencap) in June 2019 to assess the presence of contamination associated with termite control chemicals at the building block located in the northwest corner of the Project Area, and potential ACM, AF/FA contamination at the footprints of demolished building blocks. Furthermore, a DSI was undertaken by Greencap in September 2019 to assess the nature and broader extent of contamination associated with pesticides residue and ACM identified in fill material across the Site.

To further facilitate the environmental audit report for the Site, in February 2020 Agon Environmental Pty Ltd (Agon) conducted additional investigations and remediation works within the Project Area to address previously identified asbestos and pesticide-related contamination.

Between 20 July and 28 September 2020, remediation and validation works were undertaken at the Site in accordance with the approved remediation strategy. Remediation works conducted involved the following key activities.

- Stripping and excavating uncontrolled fill material to apparent natural soil conditions (either weathered rock or rock) across the Site. Spoil material and resultant excavation were inspected for evidence of any asbestos containing material (ACM) or other contaminants of potential concern (COPC). Based on visual observations, potentially impacted spoil was progressively segregated and stockpiled separately from non-impacted spoil.
- Removal of abandoned underground services including stormwater pipes, sewer pipes, electrical cables and pipes, communication cables, water supply network including irrigation and fire hydrant pipes, and visually inspecting the services, spoil, and resultant excavations for evidence of ACM or other COPC. Based on visual observations, potentially impacted spoil and services constructed out of ACM were progressively segregated and stockpiled separately from non-impacted spoil.
- Visually inspecting the surfaces of, and collecting validation samples from, the remediated areas of the Site (i.e. resultant excavations/trenches). Collated details of the areas remediated including the extent and depth of excavation, validation sample locations, sample identification numbers, date sampled and photographic logs. Submitting validation samples to be analysed by a NATA accredited laboratory.
- Inspected excavated spoil throughout the screening process for visual evidence of ACM contamination. The earthworks contractor screened geotechnically unsuitable anthropogenic waste materials such as construction and demolition rubble from the stockpiled spoil. The screened spoil was placed into smaller stockpiles and sampled by SLR's environmental consultant for characterisation purposes to inform either beneficial reuse onsite or offsite disposal. In the majority of cases stockpile material was not mixed with other stockpiled material until laboratory result were received, the material classified, and advice provided on appropriate reuse or disposal options.
- Asbestos impacted stockpiles were removed from the Site by a licenced asbestos removal contractor for appropriate offsite disposal. SLR's environmental consultant visually inspected and collected validation samples of the surface areas where asbestos material was stored for the purpose of confirming that all ACM had been adequately removed.
- Excavated areas on Lots B1, B2 and B3 were reinstated using spoil material that had been characterised as being suitable for reuse onsite. Spoil was reinstated in approximately 200 mm thick lifts. SLR's environmental consultant visually inspected each lift for the purpose of providing ACM clearance certificates.

A "live" sewer main is located along the eastern boundaries of both Lots B2 and B3, and along the southern boundary of Lot B2. Remediation works within 3 m of these boundaries were limited due to the presence of this underground service and potential destabilisation of neighbouring fences, retaining walls and structures (e.g., sheds). Remediation works conducted in this area included some topsoil stripping (to a maximum depth of 0.3 m below ground surface) and targeted removal of soil where asbestos impact was visually determined (e.g., around the sewer riser).

Contractors conducting works associated with the removal/upgrade of these "live" services were advised to employ precautionary measures such as having safe work method statements and/or work-specific management plans addressing exposure to potentially asbestos impacted soils, unexpected finds protocol and associated training, to ensure workers understood the controls required to be implemented in the unlikely event unexpected asbestos was encountered.

Remediation and validation work conducted within the wider portion of the Site are detailed in the report titled *"Validation Report, John Stokes Square Redevelopment, Proposed Residential Lots B1, B2 and B3*" (SLR VAL 2021) and is to be read in conjunction with this addendum report. A detailed review of previous investigations undertaken at the Site is also presented in the aforementioned report (SLR VAL 2021).

2.4 Source of Asbestos Impact – Site including the Sewer Easement

In summary, based on the results from previous investigations and observations noted during remediation works conducted across the Site including the sewer easement along the eastern and southern boundaries, identified asbestos impact appears to have resulted from a number of sources as described below.

- Asbestos impact identified within the uncontrolled fill material present across the Project Area (including the Site), appears to be residential building debris (mainly fragments of ACM sheeting). The presence of asbestos debris within surface soils is a common feature in Darwin due to the widespread damage caused by Cyclone Tracy in December 1974. The 1975 aerial imagery covering the Project Area, clearly shows the presence of scattered debris post Cyclone Tracy.
- Sheeting made from ACM appeared to be used as forming during the installation/construction of some of the concrete stormwater risers encountered along the boundaries between the Road Reserve, and Residential Lot B2 and Lot B3. ACM debris was also identified in the rework material around these stormwater risers.
- Asbestos impacted fill material was also identified between layers of asphalt found in the Road Reserve, which suggests that fill material impacted with asbestos debris had been used to construct (or upgrade) the road system within the Project Area.
- Pipes made from ACM products were used for the Project Area's water distribution system and in some instances used as a conduit for communications cables, and as such, are considered additional primary source of asbestos impact. Asbestos pipes were found in the middle (Road Reserve) to the southern portion of the Project Area (Residential Lot B2).
- Sewer pipes made from ACM were located within the sewer trench located within the easements located along the southern and eastern boundaries of the Project Area.

3 Remediation and Validation Methodology

3.1 Remediation Strategy

Remediation and validation activities conducted at the Site were completed in general accordance with the Auditor endorsed memorandum titled: *Remediation Strategy - John Stokes Square - Residential Lots (Lots B1, B2 and B3), ref:680.10679.00000-M04-v2.0*.

The remediation strategy was developed in general accordance with the following guidelines and standards.

- ASC NEPM 2013.
- Australian Standard AS 4482.1-2005, "Guide to the Sampling and Investigation of Potentially Contaminated Soil. Part 1: Non-volatile and semi-volatile compounds".
- WA DOH 2019, "Guidelines for the Assessment, Remediation and Management of Asbestos Contaminated Sites in Western Australia, Consultation Draft" November 2019.

- NT EPA 2017, "Northern Territory Contaminated Land Guidelines".

In addition, SLR's Standard Operating Procedures (SOPs) were followed to ensure integrity was maintained and sampling procedures were completed in general accordance with the relevant guidelines and standards.

The remediation and validation activities that were carried out within the sewer easement located along the eastern and southern boundaries of the Site were conducted in two phases, which are detailed in the following sections.

3.1.1 Removal of Uncontrolled Fill Material

The first phase of the remediation works was managed by the Principal Contractor Greenspace Pty Ltd and involved the following activities.

- The removal of the shallower fill material within the sewer easement located along the eastern and southern boundaries of the Site were removed in accordance with the *Code of Practice How to Safely Remove Asbestos 2011*.
- This fill material and any associated ACM debris encountered were placed directly into lined skip bins and removed under asbestos conditions for appropriate offsite disposal by a Class A licenced asbestos removal contractor.
- The lateral and vertical extent of the excavated area was guided by visual assessments undertaken by a suitably qualified SLR Environmental Consultant.
- The walls and base of the resultant excavation were visually inspected, and validation samples were collected, at a minimum sampling density of 1:25 m^2.
- The depth of the resultant excavation extended down into natural soils or reworked natural soils used to backfill the sewer line during its original installation.
- Details of the area remediated at the Site were collected and included the extent and depth of excavation, validation sample locations, sample identification labels, date sampled and photographic logs. Validation samples were collected and analysed by a NATA accredited laboratory in accordance with the methodology outlined in **Section 3.2.**
- Water for dust suppression was made available throughout the remediation activities undertaken at the Site.
- Air quality monitoring was undertaken during all remediation activities conducted at the Site to determine the presence of air borne asbestos fibres.
- Asbestos removal, including excavation and transport of asbestos impacted soils, was undertaken by a Class A licenced asbestos removal contractor under an approved asbestos removal control plan.
- Analytical results obtained for soil samples collected at the Site were compared to relevant ILs. If validation samples returned results above the ILs, further excavation and validation sampling would have been undertaken to ensure the Site's remediation objectives were achieved.
- All field notes, photographic logs, certified laboratory reports, asbestos clearance certificates, waste disposal documentation and air quality monitoring results were collated.
- Clearance certificates and this addendum validation report were prepared, documenting all remediation and validation works undertaken within the sewer easement located along the southern boundary of the Site.

3.1.2 Removal of Sewer Services

Once a clearance certificate for the first phase of works was received, the second phase of remediation works within the sewer easement along the southern boundary of the Site was managed by the Headworks Project's Principal Contractor (Halikos Pty Ltd). The sewer replacement/upgrade scope of works was conducted by Power and Water Corporation's contractor (Mousellis and Sons Pty Ltd). The second phase included the following activities.

- SLR oversaw the removal of spoil from the sewer trench, and the removal of the disused sewer lines. Spoil material removed was largely reworked natural soils and bedding sands that were used to backfill the sewer pipe during its original installation.
- Spoil removed from the trench was placed adjacent to the trench and visually inspected for the presence of asbestos contamination. If visual observations found ACM debris, then the ACM debris and surrounding spoil were transported to the lined skip bins for appropriate offsite disposal by a licenced asbestos removal contractor.
- As part of these asbestos clearance works, the spoil material was inspected by a suitably qualified Environmental Consultant when it was being removed from the trench, inspected when it was stockpiled adjacent to the trench and reinspected while backfilling the visually cleared trench, for evidence of asbestos contamination.
- Underground services constructed out of ACM products were removed by excavating down to the sandy bedding material surrounding these services. The sandy bedding material was then removed by a shovel (where safe to do so), to minimise damage to the asbestos pipes. The pipes were then carefully removed by the licenced asbestos removal contractor.
- The depth of the trench extended down into natural soils. After the abandoned underground services were removed, a suitably qualified environmental consultant inspected the walls and base of the resultant trench for visual signs of asbestos contamination.
- Plastic sheeting was cut and placed next to the excavation to catch any debris when removing the targeted asbestos pipe from the trench. The high-density polyethylene (HDPE) plastic was then used to wrap the ACM pipe prior to being removed from the Site for appropriate offsite disposal by a licenced asbestos removal contractor.
- Details of the area remediated at the Site were collected and included the extent and depth of excavation, date inspected and photographic logs.
- Water for dust suppression was made available throughout the remediation activities undertaken at the Site.
- Air quality monitoring was undertaken during all remediation activities conducted at the Site to determine the presence of air borne asbestos fibres.
- Asbestos removal, including excavation and transport of ACM pipes, ACM debris and potentially asbestos impacted soils, was undertaken by a licenced asbestos removal contractor under an approved asbestos removal control plan.
- All field notes, photographic logs, asbestos clearance certificates, waste disposal documentation and air quality monitoring results were collated.
- Clearance certificates and this addendum validation report were prepared, documenting all remediation and validation works undertaken within the sewer easement located along the southern boundary of the Site.

3.2 Soil Sampling Methodology

Soil validation sampling was undertaken in accordance with the RAP, the details of which are provided in **Table 2**.

Table 2 Soil Sampling Methodologies

Activity	Comment / Details
Soil sampling frequencies	• Base and walls of excavation/trench in red natural soils –visual validation only. Clearance certificates supplied by a suitably qualified Environmental Consultant. • Walls of excavation including fill material without asbestos contamination – Validation samples collected at a rate of 1:25 m^2, with a minimum of one sample per excavation wall and base (base only where excavation depth did not extend into natural soils). • Coordinates of sample locations recorded with a handheld GPS or similar device.
Sample analysis	• Validation samples analysed for percentage weight/weight asbestos content in accordance with the WA DoH guidelines.
Sample collection	• Sample collection undertaken in general accordance with WA DoH guidelines and SLR SOPs. Dedicated disposable nitrile gloves and laboratory supplied sample containers were used for sample collection.
Sample submission	• Chain of custody (COC) documentation completed at the time of sample collection and accompanied the samples to the nominated laboratory. • All samples submitted to a National Association of Testing Authorities (NATA) accredited laboratory for analysis (where possible).

3.3 Decontamination of Equipment

A 20-ton excavator was used to remove contaminated asbestos soil and abandoned underground services in the sewer easement located along the southern boundary of the Site. The excavator was solely used for the earthworks at the Site and decontamination procedures were followed. The excavator bucket was washed within asbestos stockpile footprints area and the ground surface was visually inspected and validation samples were collected to assess the contamination from the excavator.

3.4 Analytical Assessment

Validation samples were submitted to a NATA accredited laboratory (ALS Pty Ltd [ALS}) for the analyses performed.

Scheduled samples were analysed for asbestos in soils - presence/absence and/or FA/AF. The remediation and validation works previously undertaken by SLR (SLR VAL 2021) confirmed that asbestos impact, when identified, appeared to be confined to the fill material overlaying the natural deeper red silty clay soil material.

Samples collected from the wall and base of the excavation associated with Phase 1 of the remediation works were collected and analysed for presence/absence and/or FA/AF to verify whether asbestos impact was adequately removed.

3.5 Screening Criteria

The following criteria were used to assess the potential risk posed to current and future users of the Site and sites at which spoil materials could be reused.

The nominated screening criteria were selected from the following guidelines:

WA DOH:

- Soil Asbestos Screening Criteria for AF/FA, all site uses
- Soil Asbestos Screening Criteria for ACM -residential sites
- For clarity, screening criteria for asbestos will be high density residential (Residential B) as per Table 7 of the NEPM (ASC) 2013 Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater.

3.6 Air monitoring

Air monitoring was conducted for the duration of the remediation activities conducted at the Site as a precautionary measure. The airborne asbestos monitoring was conducted at the boundaries of the Site (north, south, east and west) and were static locations.

Monitors were set up at the commencement of the shift (approximately 0700) and collected at the completion of Site works (ranges from 1600 – 1700 on weekday and from 12 noon -1300 on Saturday).

Each monitor was calibrated as per SLR's internal NATA accredited procedure and set at a flow rate of 1 L/minute Monday to Friday and 2 L/min on Saturday (as the work shift is shorter, 0700 – 1300, so the flow rate is increased to ensure an appropriate sampling volume is achieved over the shorter shift).

SLR is NATA accredited in our Darwin laboratory to conduct all sampling and analysis of filters. SLR's accreditation number is 3130**.** Air monitoring was conducted in accordance with the Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Dust, 2nd Edition [NOHSC: 3003 (2005)].

All air monitoring results were compared to the public health exposure standard of 0.01 fibres/mL.

Consideration was given to the asbestos air-quality limit of 0.01 fibres/mL, for protecting the public around contaminated sites as endorsed by the enHealth Council in Management of asbestos in the non-occupational environment 2005 document (enHealth 2005).

In the event results of the airborne asbestos monitoring showed respirable asbestos fibre levels in excess of the levels outlined in **Table 3**, action was taken immediately.

Table 3 Air Monitoring Action Levels

Action Level	Control	Action
Less than 0.01 fibres/ml	No new control measures are necessary	• Continue with current control measures.
	1. Review	• Review control measures.
	2. Investigate	• Investigate the cause.

Action Level	Control	Action
At 0.01 fibres/ml or more than 0.01 fibres/ml but less than or equal to 0.02 fibres/ml	3. Implement	• Implement additional or alternative controls to eliminate or minimise exposure and prevent further releases. • Communicate any additional controls during daily pre-start meeting.
More than 0.02 fibres/ml	4. Stop removal work	• Cease excavation / transport of material.
	5. Notify Regulator	• Notify the Head Contractor, followed by the regulator (NT WorkSafe) both verbally and in written communication.
	6. Investigate the cause	• Conduct a thorough assessment across the Site to determine the cause. • Consult with all personnel involved in the works. • Determine ongoing mitigation measures. • Continue to carry out air-monitoring to ensure further controls have mitigated the problem.

Table adopted from the Code of Practice under Section 274 of *the Work Health and Safety (National Uniform Legislation) Act 2011 (the WHS Act): How to safely remove Asbestos*

4 Results

The remediation and validation activities undertaken at the Site were completed in two phases. Phase 1 was conducted between 1 and 14 September 2021, whilst the second phase was conducted between 20 September and 1 October 2021.

Civil works associated with Phase 1 were completed in general accordance with the Principal contractor's (Greenspace Pty Ltd) Construction Environmental Management Plan (CEMP) T20-1056_V2.0.

THE Mining Pty Ltd was engaged by the Principal Contractor to undertake earthworks across the Site. Earthworks were required to remove uncontrolled fill material identified within the sewer easement along the southern boundary of of the Site. Northern Trade Solutions Pty Ltd (NTS) were engaged to appropriately remove and dispose of ACM debris and asbestos impacted soils during the Phase 1 works. NTS holds a Class A Licence in asbestos removal and demolition.

Phase 2 civil works were completed in general accordance with the Headworks Project's Principal contractor's (Halikos Pty Ltd) CEMP. Sewer replacement/upgrade works were completed by Mousellis and Sons Pty Ltd who were engaged by Power and Water Corporation. Mousellis and Sons Pty Ltd were also engaged to appropriately remove bonded ACM products and ACM debris during the Phase 2 works. Mousellis and Sons Pty Ltd holds a Class B Licence in asbestos removal.

Field observations and summaries of the analytical results obtained for the remediation and validation activities undertaken within the sewer easement at the Site are provided below.

4.1 Field Observations

Key field observations noted during the remediation works at the Site are summarised as follows.

Phase 1:

- Depth of the resultant excavation ranged from 0.1 m to 1.6 m below ground surface.
- The extent of the final area excavated during Phase 1 along the eastern boundary was approximately 3.0 m wide and approximately 95 m long.
- Along the southern boundary of Lot B2, from west to east, the extent of the Phase 1 excavation was approximately 3.0 m wide for approximately 43.4 m in length and then reduced to approximately 2.0 m wide for the next 17 m (approximately), before expanding back out to 3.0 m for the remaining section to the eastern boundary.
- Near surface soils across the sewer easement consisted typically of fill material comprising of reddish -yellowish brown to light grey, fine sandy and gravelly sandy silts. The uncontrolled fill was excavated down to the red natural soil material or in the instance of the existing sewer trench, excavated down to backfill material typically consisting of reworked natural soils.
- On the eastern boundary of the Site, ACM debris were found during a visual inspection of the area near sample location E-03. This area was further excavated and reinspected before collecting a soil sample E03_0.1. An asbestos cement pipe was encountered at sample location E02. This area was further excavated including the removal of the AC pipe and reinspected before collecting soil samples B03_0.8.
- Along the southern boundary of the Site, ACM debris was found at various depths ranging from 0.1 to 0.3 m in the uncontrolled fill material. The ACM debris found in the uncontrolled fill was in poor to moderate condition and were primarily fragments of asbestos sheeting. ACM debris (broken asbestos pipe) was also found in the backfill material at depths ranging from 0.4 m to 0.8 m. The ACM debris found within the backfilled natural soil was primarily fragments of an asbestos cement pipe and appeared to be buried during the existing sewer pipe installation. This debris appeared to be in relatively bonded condition (i.e. good condition).
- ACM debris was also noted in the uncontrolled fill material on the eastern boundary between the Site and adjacent residential properties. ACM debris was removed as far as practicable, but its presence was noted to extend into the adjacent residential property.
- Asbestos debris encountered and surrounding fill material were loaded directly into lined skip bins and removed by a licensed Class A asbestos removal contractor (NTS) for appropriate offsite disposal to the Shoal Bay Waste Management Facility (SBWMF).
- For the purpose of minimising dust generation, the area to be excavated was wetted down prior to commencing excavation works. This included ripping the ground surface to facilitate water penetration into the deeper soil profile. During the excavation and skip bin loading, the spoil was sprayed continuously with water to further control dust generation and to stop potential release of asbestos fibres.
- Following the completion of the excavations works, the resultant excavation's surfaces (walls and bases) were visually inspected by a suitably qualified environmental consultant on for the presence of asbestos debris by systematically walking over the area.

- Validation soil samples were collected from the walls and base of the resultant excavations. Validation samples were then submitted to a NATA accredited laboratory for asbestos analyses. Wall samples (along the property boundary) targeting the uncontrolled fill material were submitted for presence/absence analyses. Samples collected from the base of the excavation in natural soil material were submitted for presence/absence analyses. Base samples above the existing sewer trench were analysed for both presence/absence and AF/FA.
- Locations and extent of resultant excavations are shown in the final clearance certificates issued for Eastern and Southern Sewer Easements in **Appendix B**.
- No stained or odorous soils were identified during the remediation works and removal of underground services works.

Phase 2:

- The extent of the final area trenched during Phase 2 of the remediation works was approximately 1.0 to 1.5 wide and approximately 43.4 m long along the southern boundary and approximately 95 m long along the eastern boundary. The maximum depth of the final trench was 2.0 m below ground surface.
- Spoil material removed from the trench was largely reworked natural soils and bedding sands used to backfill the sewer pipe during its original installation. As part of the asbestos clearance works, the spoil material was inspected when it was being removed from the excavation, inspected when it was stockpiled adjacent to the trench and reinspected while backfilling the cleared excavation.
- Only one fragment of bonded ACM was noted at a depth of approximately 1 m below ground surface when removing spoil from the easement along the southern boundary of Lot B2. The ACM fragment was in good condition and considered to be part of a broken asbestos pipe (different to the one that was being removed). The fragment and surrounding soil material were removed and placed into a lined skip bin for appropriate offsite disposal.
- To minimising dust generation, the area to be excavated was wetted down prior to commencing excavation works. During the trenching works and skip bin loading, spoil was sprayed with water to control dust generation and to stop potential release of asbestos fibres.
- Plastic sheeting was cut and placed next to the trench to catch any debris when removing the targeted asbestos pipe from the trench. HDPE plastic was then used to wrap the ACM pipe prior to being removed from the site for appropriate offsite disposal by a licenced asbestos removalist (Mousellis and Sons Pty Ltd).
- Following the completion of the trenching works and removal of the sewer infrastructure, the resultant trench's surfaces (bases and walls) were visually inspected where safe to do so by a suitably qualified environmental consultant for the presence of asbestos debris.
- Validation samples were not collected from the base and walls of the resultant trench, as they (i.e. walls and base) extended into the red natural soils. The bonded nature of the ACM fragments encountered, and careful methodology adopted when removing the ACM pipe, also supported the strategy of only providing a visual clearance of the resultant trench's surfaces.
- Visual inspection of the final trench and spoil material confirmed no further fragments were present.
- No stained or odorous soils were identified during the remediation works and removal of underground services works.

4.2 Summary of Analytical Results

A summary of the validation samples collected during Phase 1 of the remediation works conducted within the sewer easement located along the eastern and southern boundaries of the Site is provided in **Table 4.**

As stated in **Section 4.1**, validation samples were not collected from the base and walls of the resultant trench associated with Phase 2 of the remediation works as they (walls and base) extended into the red natural soils. The bonded nature of the single ACM fragment encountered, and careful methodology adopted when removing the ACM pipe, also supported the strategy of only providing a visual clearance of the resultant trench's surfaces.

Table 4 Summary of Validation Samples

Sample Type	Sample Identification	Analysis
Eastern sewer easement: Base samples – western bench (red natural soils)	W-01-0.1, W-02-0.1, W03-0.1, W-04, W-05, W06-0.1, W-07-0.1	*Presence/absence of asbestos in soils
Eastern sewer easement: Base samples – backfill sewer trench area	B-01-0.7, B-02-0.7, B-03-0.8, B-04-1.4, B-05-1.0, B-06-1.2, B-07-1.2, B-08-0.7	*Presence/absence of asbestos in soils *FA/AF
Eastern sewer easement: Wall samples – eastern property boundary	E-01-0.1, E-02-0.1, E-03-0.1, E-04, E-05, E-06, E-07-0.1, E-08-0.1	*Presence/absence of asbestos in soils
Southern sewer easement: Base samples – northern bench (red natural soils)	N01_0.1, N02_0.1, N03_0.1, N04_0.1, N05_0.3	*Presence/absence of asbestos in soils
Southern sewer easement: Base samples – backfill sewer trench area	B01_0.8, B02_0.8, B03_1.0, B04_0.8, B05_0.7	*Presence/absence of asbestos in soils *FA/AF
Southern sewer easement: Base samples – southern bench (red natural soils)	S01_0.2, S02_0.2, S03_0.1, S04_0.2, S05_0.2	*Presence/absence of asbestos in soils
Southern sewer easement: Wall samples – eastern property boundary	E01_0.4, E02_0.6, E03_0.3	*Presence/absence of asbestos in soils

A summary of analytical results is as follows.

Eastern Sewer Easement:

- A total of 23 soil samples were collected from the excavation area associated with the removal of uncontrolled fill material found within the sewer easement located along the eastern boundary of Lots B2 and B3.

- Validation samples from the external wall (eastern property boundary) are represented by the samples with prefix: "E". A total of eight samples were collected along the Project Area's eastern boundary. Even though samples collected from fill material would normally be analysed for FA/AF, the action of collecting 10 L sample from the eastern boundary wall was causing the fill material from the adjacent property to fall onto the Site. As such, only soil samples for presence/absence of asbestos in soils were collected from the fill layer present in the eastern property boundary of the Site.
- A total of 15 validation samples collected from the base of the excavation are represented by samples with the following prefix:
  - "W" which were collected from the surface of the western bench (natural soil material) – seven samples; and
  - "B" which were collected from the backfill natural material within the sewer trench – eight samples.
- ACM debris were found during visual inspection of the area near sample location E-03. This area was further excavated and reinspected before collecting a soil sample E03_0.1.
- Asbestos cement pipe was encountered at sample location E02. This area was further excavated including the removal of the AC pipe and inspected before collecting soil samples B03_0.8.
- Asbestos was not detected in any of the soil samples collected and submitted for laboratory analysis (presence/absence, AF/FA).
- Validation sample locations and analytical reports can be found in the final clearance certificate issued for Eastern Sewer Easement (SLR Reference 680.10679.00200-R09-v1.0-CLR-20210923) in **Appendix B**.

Southern Sewer Easement:

- A total of 19 soil samples were collected from the excavation area associated with the removal of uncontrolled fill material present within the sewer easement located along the southern boundary of Lot B2.
- A total of 15 validation samples collected from the base/benches of the excavation are represented by samples with the following prefix:
  - "N" which were collected from the surface of the northern bench (natural soil material) – five samples;
  - "B" which were collected from the backfill material within the sewer trench – five samples; and
  - "S" which were collected from the southern bench (natural soil material) – five samples.
- Four soil samples were collected from the site's eastern property boundary. These samples targeted the uncontrolled fill material that extends onto the adjacent residential property. Even though samples collected from fill material would normally be analysed for FA/AF, the action of collecting 10 L sample from the eastern boundary wall was causing the fill material from the adjacent property to fall onto the Site. As such, only soil samples for presence/absence of asbestos in soils were collected from the fill layer present in the eastern property boundary of the Site.
- Asbestos was only detected in the sample collected from the wall along the site's eastern property boundary E01-0.4. Geofabric has been placed over the eastern wall of the excavation to prevent asbestos fibres/ACM debris from falling onto the site (refer to photolog). The clearance certificate associated with these remediation works was issued subject to the continued presence of the geofabric on the eastern property boundary.

- Asbestos was not detected in any of the soil samples collected from the excavation's base/benches that were submitted for laboratory analysis (presence/absence, AF/FA).
- Validation sample locations and analytical reports can be found in the final clearance certificate issued for Southern Sewer Easement (SLR Reference 680.10679.00200-R10-v1.0-CLR-20210918) in **Appendix B**.

4.3 Clearance Inspections

Visual inspections were conducted for all excavations and trenches created at the Site as a result of the remediation activities outlined herein. No ACM debris were found during any of the clearance inspections. **Appendix B** includes the Clearance Certificates provided for visually validated areas at the Site.

SLR note that no final visual clearance certificates were issued for the Phase 2 excavations. This report serves as confirmation that all ACM that was encountered during the Phase 2 excavations was removed to a satisfactory standard.

4.4 Soil Movement and Disposal of Underground Services

Spoil removed during Phase 1 of the remediation works within the sewer easement located along the eastern and southern boundaries of the Site were placed directly into lined skip bins for appropriate disposal to the SBWMF by a licenced asbestos removal contractor (NTS). Approximately 513 tonnes (or 285 m^3 based on an assumed soil density of 1.8 for silty clayey soils) of ACM and ACM contaminated soil was disposed of to the SBWMF.

During Phase 2 of the remediation works, approximately 4.18 tonnes (or 2.32 m^3 based on an assumed soil density of 1.8 for silty clayey soils) of ACM pipe and potentially impacted spoil material were removed from the Site for appropriate disposal to the SBWMF by a licenced asbestos removal contractor (Mousellis and Sons Pty Ltd).

The SBWMF disposal receipts have been included in the final clearance certificates provided in **Appendix B**.

Spoil from the trench created when removing the abandoned sewer line (i.e. Phase 2 remediation works) were visually inspected by the Environmental Consultant for the presence of ACM. As per the Auditor endorsed remediation strategy, spoil that was visually cleared as not being impacted with ACM debris, was used to backfill the service trenches created as part of the remediation activities conducted at the Site.

Additional fill material was also brought onto the Site to backfill the resultant excavation/sewer created as part of the remediation works conducted within the sewer easement. This material was characterised from a soil contamination perspective. Details of the characterisation works (SLR Reference 680.30093.00000-M01-v1.0-20211012) has been included in **Appendix C**.

4.5 Air Monitoring

Air monitoring for airborne fibres was conducted for each day intrusive works were carried out as part of the remediation works (1 - 3, 6 - 10, 13, 14,16, 17, 20 - 24, 27 - 30 September and 1 October 2021).

Monitoring results did not report airborne fibres above the detection limit of the method used, which is 0.01 fibres/ml. Air monitoring reports for the Phase 1 remediation works have been included in the final clearance certificates provided in **Appendix B**. Air monitoring reports for the Phase 2 removal works are provided in **Appendix D**.

5 Conceptual Site Model

The Site's Conceptual Site Model (CSM) has been updated taking into account the remediation and validation works conducted at the Site (and presented in this addendum report), as well as the results from remediation works and environmental investigations undertaken at the Site.

The CSM prepared for the Site and surrounds is presented below in **Table 5** in tabulated form.

In developing the CSM, the following points were considered.

- All known asbestos impact at the Site has been remediated and resultant excavations have been validated through either soil and/or visual clearance inspections, as detailed in this addendum report and the report titled *"Validation Report, John Stokes Square Redevelopment, Lots B1, B2 and B3*" (SLR VAL 2021), which is to be read in conjunction with this report.
- Pesticide soil impact previously identified at the Site (Greencap September and October 2019) was reported to be relocated to the commercial allotment (i.e. Lot A, proposed police station) (Agon DSI 2020). Soil samples collected during the Site's remediation and validation works conducted by SLR (and presented in this report), did not report any pesticide impact above the nominated ILs specified for residential land use. As such, pesticides are no longer considered a COPC for the Site.
- Heavy metals such as arsenic, copper, lead, nickel, zinc and total chromium were detected in validation samples collected located across the Site (resulted presented in this report). None of the concentrations detected exceeded the health-based and/or ecological ILs specified for residential land use. Elevated arsenic and total chromium concentrations were reported across the Site, however further analyses confirmed that concentrations detected are indicative of natural soil conditions (SLR DSI 2020). Heavy metal impact (nickel, exceeded the EIL specified for urban residential and public open space land uses) was only detected in one sample collected from the Site during previous investigations (Agon DSI 2020). This area has been subsequently remediated and validated as part of the works conducted by SLR. Given that the concentration detected was below the human health IL for residential land uses and the level of remediation works conducted, heavy metals are not considered COPC for soil conditions at the Site.
- Groundwater beneath the wider Project Area was intersected at depths between 2.69 and 3.79 mbgl and inferred to flow in a westerly direction towards coastal mangrove community and outer estuary of Darwin Harbor (located approximately 160 m from the Project Area) (Agon DSI 2020). According to the Agon DSI report (2020), groundwater samples reported dissolved heavy metal concentrations above the nominated ILs adopted for assessing potential impacts to groundwater users and marine aquatic ecosystems.
- Future users of the Site will not extract and use groundwater from beneath the Site and as such groundwater impact in the form of dissolved heavy metals, is not considered to pose an exposure risk to future users of Lots B1, B2 and B3.

Table 5 Conceptual Site Model

Sources		Exposure	Receptors			Complete Source-Pathway-Receptor Linkage
Primary Source	Secondary Sources	Transport Mechanism Possible and Routes of Exposure	Person or Ecological Receptor Potentially Exposed	Receptor Present		
				On-site	Off-site	
None – all known primary sources of impact (i.e. uncontrolled fill, building material and services made out of ACM) have been removed from the Site.	Soil contamination: • None. All known soil impacts (i.e. asbestos) have been removed from the Site and resultant excavations validated. Note: Asbestos detected in fill material on neighbouring properties to the east of the Site.	Dispersion • Uptake via plants • Dermal contact • Incidental ingestion • Leaching via percolation Wind Erosion: • Inhalation of dusts Volatilisation • Inhalation	Residents	×	✓	× *does not exist as all known sources have been removed
			Commercial workers	×	✓	× *does not exist as all known sources have been removed
			Intrusive workers	✓	✓	× *does not exist as all known sources have been removed
			People in open spaces	✓	✓	× *does not exist as all known sources have been removed
			Ecological receptors (terrestrial biota)	✓	✓	× *does not exist as all known sources have been removed
	Groundwater Contamination: • Heavy metals	Migration of groundwater and its extraction • Dermal contact • Incidental ingestion • Inhalation	Residents	×	✓	× *although bores exist within the locality, the SPR linkage is not considered viable as groundwater within the locality is not expected to be used for domestic purposes especially given the availability of a reticulated, treated (mains) water supply and low groundwater yield..

Sources		Exposure	Receptors			Complete Source-Pathway-Receptor Linkage
Primary Source	Secondary Sources	Transport Mechanism Possible and Routes of Exposure	Person or Ecological Receptor Potentially Exposed	Receptor Present		
				On-site	Off-site	
		• Terrestrial/ aquatic Groundwater impact is not volatile and therefore exposure pathway associated with the "migration of groundwater – volatilisation – inhalation" is not considered to exist.	Commercial workers	✗	✓	✗ *although bores exist within the locality, the SPR linkage is not considered viable as groundwater within the locality is not expected to be used for commercial purposes especially given the availability of a reticulated, treated (mains) water supply and low groundwater yield. There is no design to establish a bore onsite for future users of the Site.
			Intrusive workers	✓	✓	✗ *does not exist as groundwater is located at depths greater than 2.69 mbgl and as such is unlikely to enter typical excavations/underground service pits located either on site or within the surrounding locality.
			People in open spaces	✓	✓	✗ *does not exist as groundwater is not expected to be used by users of public open spaces.
			Ecological receptors (terrestrial and aquatic biota)	✗ (terrestrial only)	✓	**Potentially Complete** *possible that ground impact (dissolved heavy metals) could migrate offsite to the coastal mangrove communities located approximately 160 m west of the Project Area.

6 Conclusion

Based on the field observations and analytical results obtained for the remediation and validation activities conducted at the Site by SLR, SLR considers that the proposed residential allotments Lot B1, Lot B2 and Lot B3 have been suitably remediated and validated for the proposed land use (high density residential), subject to the considerations outlined in this addendum report and the main validation report (SLR, VAL 2021).

7 Limitations

The following information will assist in understanding the uncertainties relating to the interpretation of the data obtained during this investigation and the recommendations presented in the report and help with assessment and interpretation of the report.

SLR assumes no responsibility for the quality or accuracy of data obtained from external sources, or for occurrences outside the scope of works defined in this report.

All work conducted, and reports produced by SLR are prepared for a particular Client's objective and are based on a specific scope, conditions and limitations, as agreed upon between SLR and the Client. Information and/or report(s) prepared by SLR may therefore not be suitable for any use other than the intended objective.

Before passing on to a third party any information and/or report(s) prepared by SLR, the Client is to inform fully the third party of the objective and scope, and all limitations and conditions, including any other relevant information which applies to the information and/or report(s) prepared by SLR.

It is the responsibility of third parties to investigate fully to their satisfaction if any information and/or report(s) prepared by SLR, is suitable for a specific objective.

Services were conducted in a conscientious and professional manner. The nature of the task, however, and the likely disproportion between any damage or loss which might arise from the work and any report prepared as a result and the cost of our services is such that SLR cannot guarantee that all issues of concern/contamination have been identified.

The report(s) and/or information produced by SLR should not be reproduced and/or presented/reviewed except in full.

Phase 1 Clearance Certificates

ASBESTOS CLEARANCE CERTIFICATE

Job Number:	680.10679.00200	Document Ref:	680.10679.00200-R09-v1.0-CLR-20210923.docx
Date of Issue:	23 September 2021	Signatures:	
Clearance Inspection Undertaken By and Competency:	Robin Birua Environmental Scientist		

1	CLIENT DETAILS	
1.1	Client Name:	HK Solutions Pty Ltd on behalf of Department of Infrastructure, Planning and Logistics.
1.2	Client Contact Name:	Tony Hopkinson
1.3	Client Address:	Building 2, Level 1 631 Stuart Highway Berrimah NT 0828
1.4	Client Telephone Number:	0410 824 575

2	ASBESTOS REMOVAL DETAILS			
2.1	Date of Clearance Inspections:	8 September 2021	Time of Clearance Inspection:	1500 (8 September 2021)
2.2	Site Address:	47 Progress Drive, Nightcliff, Darwin, Northern Territory (the Project Area)		
2.3	Asbestos Removal Location:	• Uncontrolled fill material that has historically contained debris of asbestos containing material (ACM) was present in the sewer easement located on the southern and eastern boundaries of the Project Area. • SLR were engaged to oversee the removal of this uncontrolled fill material within the sewer easement, down to either natural soils or in the area where the existing sewer trench is located - backfill material (i.e. mostly reworked natural soils). • The removal of uncontrolled fill material within the sewer easement has been undertaken in three phases. This clearance report has been prepared with respect to the second phase of the proposed work, which includes the removal of uncontrolled fill from the sewer easement located at the eastern boundary within the new allotments referred to Lot B2 and Lot B3. • The extent of the excavation that this Clearance Certificate applies to is shown in Appendix A. • The removal of the uncontrolled fill material containing ACM debris was undertaken by a Class A licensed asbestos removalist, Northern Trade Solutions (NTS) under asbestos conditions. Removal works commenced on 1 September and were completed on 8 September 2021 for the second phase of the proposed works. • The material excavated was placed directly into skip bins for appropriate offsite disposal to a licensed waste management facility (Shoal Bay Waste Management Facility) (SBWMF)). Disposal dockets have been included in Appendix E.		

2	ASBESTOS REMOVAL DETAILS	
		• On 8 September 2021, once the uncontrolled fill material and some of the reworked backfilled material that appeared to contain ACM debris had been removed, SLR visually inspected the surfaces of the excavation for evidence of ACM debris and collected validation soil samples from the walls and base. • Appendix A shows the locations of the validation samples collected. • Samples were submitted to a NATA accredited laboratory for analysis (ALS Pty Ltd).
2.4	Asbestos Removal Contractor Company & Licence Number:	Northern Trade Solutions (NTS) EPL 225
2.5	Asbestos Removal Contractor Supervisor & Licence Number:	Tony Karambetis CPCCDE3015A
2.6	Details of Asbestos Removal Activities and Areas Inspected:	Uncontrolled Fill Material Oversight (1 – 8 September 2021): • The removal of uncontrolled fill material, including asbestos debris, was conducted on between 1 and 8 September 2021 and were excavated in accordance with the NT WorkSafe "Code of Practice How to Safely Remove Asbestos 2011". • Depth of the resultant excavation ranged from 0.1 m to 1.6 m below ground surface. The deeper excavation depths were within the existing sewer trench. • The uncontrolled fill was characterised by dark grey coloured sandy silt and included some organic matter and vegetation. The uncontrolled fill was excavated down to the red natural soil material or in the instances of the existing sewer trench, excavated down to backfill material typically consisting of reworked natural soils. • ACM debris was found in various depths ranging from 0.3 m to 1.3 m below ground surface. The ACM debris was primarily fragments of asbestos sheeting and broken pieces of asbestos cement pipe. The condition of the ACM debris ranged from poor (ACM sheeting) to moderate (asbestos cement pipe). • Relatively more ACM debris was found in the eastern boundary wall within Lot B2 (next to the adjacent property's recreational spa) and the debris was in poor to moderate condition. • One asbestos cement pipe, approximately 1.0 m long, was found at a depth of 0.5 m below ground surface within the sewer easement and was subsequently removed (refer to Appendix A for the approximate location). • The extent of the final area excavated was approximately 3.0 m wide and approximately 95 m long. • To minimise dust generation, the area to be excavated was wetted down prior to commencing excavation works. This included ripping the ground surface to facilitate water penetration into the deeper soil profile. • Asbestos debris encountered and surrounding fill material were loaded directly into lined skip bins and removed by a licensed "Class A" asbestos removalist (NTS) for appropriate offsite disposal to the SBWMF. • During the excavation and skip bin loading, the spoil was sprayed continuously with water to control dust generation and to stop potential release of asbestos fibres.

2	ASBESTOS REMOVAL DETAILS	
		• As part of these works, approximately 145 m^3 of asbestos impacted uncontrolled fill material including asbestos debris and asbestos cement pipe were removed from the site for appropriate offsite disposal. • One excavator was used solely for the excavation of ACM debris and potentially asbestos impacted soil between 1 and 8 September 2021. This excavator was then decontaminated after the completion of excavation and removal of uncontrolled fill including asbestos impacted soil within the southern easement of Lot B2 (i.e. after Phase 3 was completed). • Following the completion of the excavations works, the resultant excavation's surfaces (walls and bases) were visually inspected by a suitably qualified environmental consultant for the presence of asbestos debris by systematically walking over the area. • Validation soil samples were collected from walls and base of the resultant excavation on 7 and 8 September 2021. Validation samples were then submitted to a National Association of Testing Authorities (NATA) accredited laboratory for asbestos analyses. Wall samples (along the property boundary) targeting the uncontrolled fill material were submitted for presence/absence analyses. Validation soil samples from the shallower benches were collected and submitted for presence/absence asbestos analyses. Samples collected from the backfill material within the existing sewer trench were also analysed for asbestos fines/fibrous asbestos (AF/FA) analyses.

3	CLEARANCE INSPECTIONS – VISUAL	
3.1	Method:	• Visual inspections of the excavated areas created due to the removal of asbestos debris and impacted soils at the site were undertaken by a suitably qualified environmental consultant from SLR. • The base and walls of the excavation were visually inspected for ACM debris and representative soil samples were also collected from the excavation's surfaces (i.e. walls and base). • Asbestos material encountered during the removal of fill material were removed in accordance with the Code of Practice How to Safely Remove Asbestos 2011. Refer to Appendix A for details of the area where visual clearance for asbestos related impact have been undertaken at the site.
3.2	Visual Summary:	It is the opinion of Robin Birua of SLR that the excavated area associated with the removal of ACM and potentially asbestos impacted soil as detailed in Section 2.6 of this Clearance Certificate, have been visually inspected, as far as reasonably practicable and are free from visible ACM in the fill layer and natural soil surface, unless specified otherwise in Section 2.6. Representative photographs of the area inspected, following removal of asbestos impacted soil and asbestos, are provided at Appendix B.

3	CLEARANCE INSPECTIONS – VISUAL	
3.3	Limitations:	It should however be noted that: • The Visual Clearance Inspection and Clearance Certificate are limited to accessible visible surfaces as detailed in Section 2.6 only. • Inspections are conducted in a conscientious and professional manner. The nature of the task and the likely disproportion between any damage or loss which might arise from the work or Clearance Certificate prepared and the cost of our services, is such that SLR cannot guarantee that all asbestos materials/issues of concern have been identified and/or addressed. • Unless specified in this Clearance Certificate, this Clearance Certificate does not guarantee that the dust present in or around those areas mentioned in Section 2.3 and Section 2.6 of this Clearance Certificate are free of asbestos contamination. The inspection is for visible ACM as detailed in Section 2.6 only. • It is possible that ACM are present in areas that were inaccessible/visually obscured during the inspection. If any ACM or assumed ACM fragments are encountered on site, access to the materials should be appropriately restricted and advice sought from a suitably qualified and experienced consultant. • The inspections were carried out at the times of the completion of the remediation works and were dependent upon site conditions at that time. • SLR accepts no responsibility or liability for the completeness of the removal by the appointed licensed asbestos removal contractor. The appointed licensed asbestos removal contractor is responsible for ensuring all work is conducted in a safe and competent manner by suitably trained staff, the necessary approvals are obtained from regulatory authorities prior to starting any asbestos removal or maintenance activities (if applicable) and that work methods and procedures comply with the relevant legislation, codes of practice and industry standards, as required.

4	CLEARANCE INSPECTION - ASBESTOS AIRBORNE FIBRE MONITORING	
4.1	Background Monitoring:	Air monitoring for airborne fibres was conducted for each day of intrusive works were carried out as part of the asbestos removal works. Four monitoring stations were setup at the boundary of the excavation area, positioned in line with adjacent sensitive receptors (residents). Only control (as required) airborne fibre monitoring was conducted, in general accordance with Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Dust, 2nd Edition [NOHSC: 3003 (2005)] and SLR's in-house technical procedures.
4.2	Clearance Monitoring:	Clearance airborne fibre monitoring was not requested and does not form a part of this Clearance Certificate.
4.3	Results:	The analysis of all asbestos airborne fibre monitoring was undertaken by SLR at our NATA accredited laboratory. All airborne asbestos monitoring results showed less than the minimum detection limit of the method used which is 0.01 fibres/mL (refer to the SLR Airborne Asbestos Monitoring Reports ref: 680.10679.00200-AADZ-7 through to 680.10679.00200-AADZ-12 that are included in Appendix C.

5	VALIDATION SAMPLE RESULTS	
5.1	Method:	• Validation samples were collected from the base/benched surfaces and external wall (eastern property boundary) of the excavation at a minimum rate of one sample per 25m^2 and one sample per five linear metres. • Samples were collected in general accordance with AS4482.1-2005 and SLR's standard operating procedures (SOPs). Dedicated disposable nitrile gloves, a decontaminated trowel and laboratory supplied sample containers were used for sample collection. • Validation soil samples were collected from the base and external wall (eastern property boundary) of the resultant excavation, as detailed in Section 2.3, Section 2.6 and locations are shown in Appendix A. The purpose of these samples was to confirm that ACM impacted soil material had been removed from the area to a satisfactory standard. • All samples were submitted to a NATA accredited laboratory (ALS Pty Ltd) for analysis. • The base samples were collected form the benches' surface (natural soil material) and from the backfill material within the sewer trench. The wall samples were collected along the property boundary, targeting the uncontrolled fill material layer that extends offsite. • For each sample that targeted the backfill material in the existing sewer trench, a 10 L sample was collected in a bucket and passed through a 7mm grid sieve. The material that did not pass through the sieve was inspected for the presence of any potential ACM debris and if found, samples of the fragments were collected and submitted to a NATA accredited laboratory for identification purposes. • Following a visual inspection of the less than 7 mm fraction of sieved soil, a sub-sample (at least 500 mL) was collected and submitted for laboratory analyses. Asbestos analysis for the samples included presence/absence and AF/FA in general accordance with the Western Australia Department of Health's Guidelines for the Assessment, Remediation and Management of Asbestos-Contamination Sites in Western Australia (WA DoH 2021).

5.2	Results:	• The certified laboratory report received for the soil samples collected during this clearance is included in Appendix D.
		• A total of 23 soil samples were collected from the excavation area associated with the removal of uncontrolled fill material found within the sewer easement on Lots B2 and B3.
		• Validation samples from the external wall (eastern property boundary) and eastern bench are represented by the samples with prefix: "E". A total of 8 samples were collected along the Project Area's eastern boundary.
		• A total of 15 validation samples collected from the base of the excavation are represented by samples with the following prefix:
		  ◦ "W" which were collected from the surface of the western bench (natural soil material) – 7 samples; and
		  ◦ "B" which were collected from the backfill natural material within the sewer trench – 8 samples.
		• ACM debris were found during visual inspection of the area near sample location E-03. This area was further excavated and reinspected before collecting a soil sample E03_0.1.
		• Asbestos cement pipe was encountered at sample location E02. This area was further excavated including the removal of the AC pipe and inspected before collecting soil samples B03_0.8.

		• Asbestos was not detected in any of the soil samples collected and submitted for laboratory analysis (presence/absence, AF/FA).

6	RE-OCCUPATION
6.1	It is the opinion of SLR that the areas detailed in Section 2.3 and outlined in Appendix A of this Clearance Certificate are fit for re-occupation and for normal excavation works to proceed. The asbestos removal work area and the surrounding area have been inspected, as far as reasonably practicable, and are considered to be free of visible assumed or suspected asbestos debris, unless specified otherwise in Section 2.6. Within the scope of works executed, all asbestos impacted soil materials have been stripped from the area of excavation as per Section 2.6 of this Clearance Certificate (please note the limitations in Section 3.3). While SLR carries out the work to the best of our ability, we totally exclude any loss or damages which may arise from services provided to the Client and/or associated parties. This Clearance Certificate and/or information produced by SLR should not be reproduced and/or presented/reviewed except in full.

APPENDIX B

Representative Photographic log

Removal of uncontrolled fill material - 1 – 8 September 2021

Photo 01 – Photo of the sewer easement along the eastern boundary of Lot B2 and B3. Photo taken from the north eastern corner of Lot B3 looking south.

Photo 02 – photo of manhole after the removal of asbestos pipe buried at 0.5m bgs within reworked backfilled material sewer trench.

Photo 03 – Photo of a trench after the removal of ACM in the backfilled material adjacent to the vent and sewer manhole.

Photo 04 – No excavation around the sewer manhole. This area was validated by SLR during the ACM removal in residential lots.

Photo 05–View of the eastern wall adjacent to the neighboring property's spa (eastern boundary) after the removal of large sheets of ACM in the uncontrolled fill

Photo 06 – Photo of the sewer easement after the removal of uncontrolled fill mateiral from Lot B2. The photograph was taken from the south east corner of Lot B2 facing towards north.

Visual Clearance of Excavation – 1 - 8 September 2021	
Photo 07 – View of ACM debris in poor to moderate condition identified on the eastern wall at the south east corner of Lot B2 adjacent to the sewer manhole. Area covered in 690.10679.00300-R10-v1.0-CLR2.	Photo 08 –Photo of asbestos cement pipe located adjacent to the manhole at northern part of the Lot B3 (refer to Appendix A for the location of where the asbestos pipe was found).

Dates

Date Samples Received	: 03-Sep-2021 09:30	Issue Date	: 06-Sep-2021
Client Requested Due Date	: 10-Sep-2021	Scheduled Reporting Date	: **10-Sep-2021**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: ----	Temperature	: ----
Receipt Detail	:	No. of samples received / analysed	: 5 / 5

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EN2107718**	Page	: 1 of 4
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Newcastle
Contact	: JULIE McDOWELL	Telephone	: +61 2 4014 2500
Project	: 680.10679 John Stokes	Date Samples Received	: 03-Sep-2021
Site	: ----	Issue Date	: 07-Sep-2021
Sampler	: JAMES MURDOCH	No. of samples received	: 5
Order number	: ----	No. of samples analysed	: 5

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Signatories	*Position*	*Accreditation Category*
Brendan Schrader	Laboratory Technician	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Brendan Schrader	Laboratory Technician	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EN2107878**	Page	: 1 of 4
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Newcastle
Contact	: JULIE McDOWELL	Telephone	: +61 2 4014 2500
Project	: 680.10679 John Stokes	Date Samples Received	: 08-Sep-2021
Site	: ----	Issue Date	: 09-Sep-2021
Sampler	: JAMES MURDOCH	No. of samples received	: 11
Order number	: ----	No. of samples analysed	: 11

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EN2107911**	Page	: 1 of 4
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Newcastle
Contact	: JULIE McDOWELL	Telephone	: +61 2 4014 2500
Project	: 680.10679 John Stokes	Date Samples Received	: 09-Sep-2021
Site	: ----	Issue Date	: 10-Sep-2021
Sampler	: JAMES MURDOCH	No. of samples received	: 7
Order number	: 680.30073	No. of samples analysed	: 7

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).

ASBESTOS CLEARANCE CERTIFICATE

Job Number:	680.10679.00200	Document Ref:	680.10679.00200-R10-v1.0-CLR-20210918.docx
Date of Issue:	18 September 2021	Signatures:	
Clearance Inspection Undertaken By and Competency:	Robin Birua Environmental Scientist		

1	CLIENT DETAILS	
1.1	Client Name:	HK Solutions Pty Ltd on behalf of Department of Infrastructure, Planning and Logistics.
1.2	Client Contact Name:	Tony Hopkinson
1.3	Client Address:	Building 2, Level 1 631 Stuart Highway Berrimah NT 0828
1.4	Client Telephone Number:	0410 824 575

2	ASBESTOS REMOVAL DETAILS			
2.1	Date of Clearance Inspections:	14 September 2021	Time of Clearance Inspections:	1600 (14 September 2021)
2.2	Site Address:	47 Progress Drive, Nightcliff, Darwin, Northern Territory (the Project Area)		
2.3	Asbestos Removal Location:	• Uncontrolled fill material that has historically contained debris of asbestos containing material (ACM) was present in the sewer easement located on the southern and eastern boundaries of the Project Area. • SLR were engaged to oversee the removal of this uncontrolled fill material within the sewer easement, down to either natural soils or in the area where the existing sewer trench is located - backfill material (i.e. mostly reworked natural soils). • The removal of uncontrolled fill material within the sewer easement has been undertaken in three phases. This clearance report has been prepared with respect to the third phase of the proposed work, which includes the removal of uncontrolled fill from the sewer easement located at the southern boundary within the new allotment referred to Lot B2. • The extent of the excavation that this Clearance Certificate applies to is shown in Appendix A. • The removal of the uncontrolled fill material containing ACM debris was undertaken by a Class A licensed asbestos removalist, Northern Trade Solutions (NTS) under asbestos conditions. Removal works commenced on 9 September and was completed on 14 September 2021 for Phase 3 of the proposed works. • The material excavated was placed directly into skip bins for appropriate offsite disposal to a licensed waste management facility (Shoal Bay Waste Management Facility) (SBWMF)). Disposal dockets have been included in Appendix E.		

2	ASBESTOS REMOVAL DETAILS	
		• On 14 September 2021, once the uncontrolled fill material had been removed, SLR visually inspected the surfaces of the excavation for evidence of ACM debris and collected validation soil samples from the walls and base. • Appendix A shows the locations of the validation samples collected. • Samples were submitted to a NATA accredited laboratory for analysis (ALS Pty Ltd).
2.4	Asbestos Removal Contractor Company & Licence Number:	Northern Trade Solutions (NTS) EPL 225
2.5	Asbestos Removal Contractor Supervisor & Licence Number:	Tony Karambetis CPCCDE3015A
2.6	Details of Asbestos Removal Activities and Areas Inspected:	Uncontrolled Fill Material Oversight (9 – 14 September 2021): • The removal of uncontrolled fill material, including asbestos debris, was conducted on between 9 and 14 September 2021 and were excavated in accordance with the NT WorkSafe "Code of Practice How to Safely Remove Asbestos 2011". • Depth of the resultant excavation ranged from 0.1 m to 1.2 m below ground surface. The deeper excavation depths were within the existing sewer trench. • The uncontrolled fill was characterised by dark grey coloured sandy silt and included some organic matter and vegetation. The uncontrolled fill was excavated down to the red natural soil material or in the instance of the existing sewer trench, excavated down to backfill material typically consisting of reworked natural soils. • ACM debris was found at various depths ranging from 0.1 to 0.3 m in the uncontrolled fill material. ACM debris (broken asbestos pipe) was also found in the backfill material at depths ranging from 0.4 to 0.8 m. • The ACM debris found in the uncontrolled fill was in poor to moderate condition and were primarily fragments of asbestos sheeting. • The ACM debris found within the backfilled natural soil was primarily fragments of an asbestos cement pipe and appeared to be buried during the existing sewer pipe installation. This debris appeared to be in relatively bonded condition (i.e. good condition). • ACM debris was also noted in the uncontrolled fill material on the eastern boundary between the site and adjacent residential properties. ACM debris was removed as far as practicable, but its presence was noted to extend into the adjacent residential property. • From west to east, the extent of the final area excavated was approximately 3.0 m wide by and approximately 43.4 m long and then reduced to approximately 2.0m wide for approximately 17 m (approximately) before expanding back out to 3.0m for the remaining section towards the eastern boundary. • To minimising dust generation, the area to be excavated was wetted down prior to commencing excavation works. This included ripping the ground surface to facilitate water penetration into the deeper soil profile. • Asbestos debris encountered and surrounding fill material were loaded directly into lined skip bins and removed by a licensed "Class A" asbestos removalist (NTS) for appropriate offsite disposal to the SBWMF.

2	ASBESTOS REMOVAL DETAILS	
		• During the excavation and skip bin loading, the spoil was sprayed continuously with water to control dust generation and to stop potential release of asbestos fibres. • As part of these works, approximately 140 m^3 of asbestos impacted uncontrolled fill material including asbestos debris were removed from the site for appropriate offsite disposal. • One excavator was used solely for the excavation of ACM debris and potentially asbestos impacted soil between 9 and 14 September 2021. This excavator was then decontaminated prior to demobilise from the site. • Following the completion of the excavations works, the resultant excavation's surfaces (bases and walls) were visually inspected by a suitably qualified environmental consultant for the presence of asbestos debris by systematically walking over the area. • Validation soil samples were collected from resultant benches and base of the resultant excavation on 14 September 2021. Validation samples were then submitted to a National Association of Testing Authorities (NATA) accredited laboratory for asbestos analyses. Validation soil samples from the shallower benches were collected and submitted for presence/absence asbestos analyses. Samples collected from the backfill material within the existing sewer trench were also analysed for asbestos fines/fibrous asbestos (AF/FA) analyses. • A sample was also collected from the uncontrolled fill layer on the eastern wall of the excavation and analysed for presence/absence asbestos analysis.

3	CLEARANCE INSPECTIONS – VISUAL	
3.1	Method:	• Visual inspections of the excavated areas created due to the removal of asbestos debris and impacted soils at the site were undertaken by a suitably qualified environmental consultant from SLR. • The base and walls of the excavation were visually inspected for ACM debris and representative soil samples were also collected from the excavation's surfaces (i.e. walls and base). • Asbestos material encountered during the removal of fill material were removed in accordance with the Code of Practice How to Safely Remove Asbestos 2011. Refer to Appendix A for details of the area where visual clearance for asbestos related impact have been undertaken at the site.
3.2	Visual Summary:	It is the opinion of Robin Birua of SLR that the excavated area associated with the removal of ACM and potentially asbestos impacted soil as detailed in Section 2.6 of this Clearance Certificate, have been visually inspected, as far as reasonably practicable and are free from visible ACM in the fill layer, unless specified otherwise in Section 2.6 (i.e. ACM debris noted in the eastern property boundary wall). Representative photographs of the area inspected, following removal of asbestos impacted soil, are provided at Appendix B.

3	CLEARANCE INSPECTIONS – VISUAL	
3.3	Limitations:	It should however be noted that: • The Visual Clearance Inspection and Clearance Certificate are limited to accessible visible surfaces as detailed in Section 2.6 only. • Inspections are conducted in a conscientious and professional manner. The nature of the task and the likely disproportion between any damage or loss which might arise from the work or Clearance Certificate prepared and the cost of our services, is such that SLR cannot guarantee that all asbestos materials/issues of concern have been identified and/or addressed. • Unless specified in this Clearance Certificate, this Clearance Certificate does not guarantee that the dust present in or around those areas mentioned in Section 2.3 and Section 2.6 of this Clearance Certificate are free of asbestos contamination. The inspection is for visible ACM as detailed in Section 2.6 only. • It is possible that ACM are present in areas that were inaccessible/visually obscured during the inspection. If any ACM or assumed ACM fragments are encountered on site, access to the materials should be appropriately restricted and advice sought from a suitably qualified and experienced consultant. • The inspections were carried out at the times of the completion of the remediation works and were dependent upon site conditions at that time. • SLR accepts no responsibility or liability for the completeness of the removal by the appointed licensed asbestos removal contractor. The appointed licensed asbestos removal contractor is responsible for ensuring all work is conducted in a safe and competent manner by suitably trained staff, the necessary approvals are obtained from regulatory authorities prior to starting any asbestos removal or maintenance activities (if applicable) and that work methods and procedures comply with the relevant legislation, codes of practice and industry standards, as required.

4	CLEARANCE INSPECTION - ASBESTOS AIRBORNE FIBRE MONITORING	
4.1	Background Monitoring:	Air monitoring for airborne fibres was conducted for each day of intrusive works were carried out as part of the asbestos removal works. Four monitoring stations were setup at the boundary of the excavation area, positioned in line with adjacent sensitive receptors (residents). Control (as required) and background airborne fibre monitoring was conducted, in general accordance with Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Dust, 2nd Edition [NOHSC: 3003 (2005)] and SLR's in-house technical procedures.
4.2	Clearance Monitoring:	Clearance airborne fibre monitoring was not requested and does not form a part of this clearance certificate.
4.3	Results:	The analysis of all asbestos airborne fibre monitoring was undertaken by SLR at our NATA accredited laboratory. All airborne asbestos monitoring results showed less than the minimum detection limit of the method used which is 0.01 fibres/mL (refer to the SLR Airborne Asbestos Monitoring Reports ref: 680.10679.00200-AADZ-13 through to 680.10679.00200-AADZ-16 that are included in Appendix C.

5	VALIDATION SAMPLE RESULTS	
5.1	Method:	• Validation samples were collected from the base/benched surfaces and external wall (eastern property boundary) of the excavation at a minimum rate of one sample per 25m^2 and one sample per five linear metres. • Samples were collected in general accordance with AS4482.1-2005 and SLR's standard operating procedures (SOPs). Dedicated disposable nitrile gloves, a decontaminated trowel and laboratory supplied sample containers were used for sample collection. • Validation soil samples were collected from the base and external wall (eastern property boundary) of the resultant excavation, as detailed in Section 2.3, Section 2.6 and locations are shown in Appendix A. The purpose of these samples was to confirm that ACM impacted soil material had been removed from the area to a satisfactory standard. • All samples were submitted to a NATA accredited laboratory (ALS Pty Ltd) for analysis. • The base samples were collected from the benches' surfaces (natural soil material) and from the backfill material within the sewer trench. The wall sample was collected along the property boundary, targeting the uncontrolled fill material layer that extends offsite. • For each sample that targeted the backfill material in the existing sewer trench, a 10 L sample was collected in a bucket and passed through a 7mm grid sieve. The material that did not pass through the sieve was inspected for the presence of any potential ACM debris and if found, samples of the fragments were collected and submitted to a NATA accredited laboratory for identification purposes. • Following a visual inspection of the less than 7 mm fraction of sieved soil, a sub-sample (at least 500 mL) was collected and submitted for laboratory analyses. Asbestos analysis for the samples included presence/absence and AF/FA in general accordance with the Western Australia Department of Health's Guidelines for the Assessment, Remediation and Management of Asbestos-Contamination Sites in Western Australia (WA DoH 2009).

5.2	Results:	• The certified laboratory report received for the soil samples collected during this clearance is included in Appendix D.
		• A total of 16 soil samples were collected from the excavation area associated with the removal of uncontrolled fill material present within the sewer easement on Lot B2.
		• A total of 15 validation samples collected from the base/benches of the excavation are represented by samples with the following prefix:
		  ◦ "N" which were collected from the surface of the northern bench (natural soil material) – 5 samples;
		  ◦ "B" which were collected from the backfill material within the sewer trench – 5 samples; and
		  ◦ "S" which were collected from the southern bench (natural soil material – 5 samples.
		• One soil sample was collected from the site's eastern property boundary (E01-0.4). This sample targeted the uncontrolled fill material that extends onto the adjacent residential property.
		• Asbestos was only detected in the sample collected from the wall along the site's eastern property boundary E01-0.4.
		• Geofabric has been placed over the eastern wall of the excavation to prevent asbestos fibres/ACM debris from falling onto the site (refer to photolog). This clearance certificate is issued subject to the continued presence of the geofabric on the eastern property boundary.

		• Asbestos was not detected in any of the soil samples collected from the excavation's base/benches that were submitted for laboratory analysis (presence/absence, AF/FA).

6	RE-OCCUPATION
6.1	It is the opinion of SLR that the areas detailed in Section 2.3 and outlined in Appendix A of this Clearance Certificate are fit for re-occupation and for normal excavation works to proceed. The asbestos removal work area and the surrounding area have been inspected, as far as reasonably practicable, and are considered to be free of visible assumed or suspected asbestos debris, unless specified otherwise in Section 2.6 (i.e. eastern property boundary wall). Within the scope of works executed, all asbestos impacted soil material has been stripped from the area of excavation as per Section 2.6 of this Clearance Certificate (please note the limitations in Section 3.3). As asbestos was detected in the soil sample collected from the site's eastern property boundary, geofabric has been placed over the eastern wall of the excavation to prevent asbestos fibres/ACM debris from falling onto the site. This clearance certificate is issued subject to the continued presence of the geofabric on the eastern property boundary. While SLR carries out the work to the best of our ability, we totally exclude any loss or damages which may arise from services provided to the Client and/or associated parties. This Clearance Certificate and/or information produced by SLR should not be reproduced and/or presented/reviewed except in full.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Sample ID	Sample Container Received	Preferred Sample Container for Analysis
Asbestos Classification and Quantitation per NEPM 2013 : EA200N		
B01_0.8	- Snap Lock Bag	- Snap Lock Bag: Separate bag received
B02_0.8	- Snap Lock Bag	- Snap Lock Bag: Separate bag received
B03_1.10	- Snap Lock Bag	- Snap Lock Bag: Separate bag received
B04_0.8	- Snap Lock Bag	- Snap Lock Bag: Separate bag received
B05_0.7	- Snap Lock Bag	- Snap Lock Bag: Separate bag received

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Brendan Schrader	Laboratory Technician	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EA200N: Asbestos weights and percentages are not covered under the Scope of NATA Accreditation.
  Weights of Asbestos are based on extracted bulk asbestos, fibre bundles, and/or ACM and do not include respirable fibres (if present)
  The Asbestos (Fines and Fibrous) weight is calculated from the extracted Fibrous Asbestos and Asbestos Fines as an equivalent weight of 100% Asbestos
  Percentages for Asbestos content in ACM are based on the 2013 NEPM default values.
  All calculations of percentage Asbestos under this method are approximate and should be used as a guide only.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200N: ALS laboratory procedures and methods used for the identification and quantitation of asbestos are consistent with AS4964-2004 and the requirements of the 2013 NEPM for Assessment of Site Contamination
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Newcastle
Contact	: JULIE McDOWELL	Contact	: Hannah White
Address	: Unit 5 21 Parap Rd DARWIN 0800	Address	: 5/585 Maitland Road Mayfield West NSW Australia 2304
Telephone	: ----	Telephone	: +61 2 4014 2500
Project	: 680.10679 DIPL John Stokes Square - Lot 82 Sewer Easement	Date Samples Received	: 16-Sep-2021
Order number	: ----	Date Analysis Commenced	: 16-Sep-2021
C-O-C number	: ----	Issue Date	: 16-Sep-2021
Sampler	: ROBIN BIRUA		
Site	: ----		
Quote number	: EN/032/20 Primary Work Only		
No. of samples received	: 18		
No. of samples analysed	: 18		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Brendan Schrader	Laboratory Technician	Newcastle - Asbestos, Mayfield West, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

- **No Method Blank (MB) or Laboratory Control Spike (LCS) Results are required to be reported.**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EN2108121**	Page	: 1 of 4
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Newcastle
Contact	: JULIE McDOWELL	Telephone	: +61 2 4014 2500
Project	: 680.10679 DIPL John Stokes Square - Lot 82 Sewer Easement	Date Samples Received	: 16-Sep-2021
Site	: ----	Issue Date	: 16-Sep-2021
Sampler	: ROBIN BIRUA	No. of samples received	: 18
Order number	: ----	No. of samples analysed	: 18

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis		
		Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Asbestos Classification and Quantitation per NEPM 2013	* EA200N	SOIL	Asbestos Classification and Quantitation per NEPM with Confirmation of Identification by AS 4964 - Gravimetric determination of Asbestos Containing Material, Fibrous Asbestos, Asbestos Fines and sample weight and calculation of percentage concentrations per NEPM protocols. Asbestos (Fines and Fibrous FA+AF) is reported as the equivalent weight in the sample received after accounting for sub-sampling (where applicable for the <7mm and/or <2mm fractions).

APPENDIX C

Imported Fill Soil Characterisation Report

Memorandum

To:	John Mousellis	At:	Mousellis & Sons Pty Ltd
From:	Julie McDowell	At:	SLR Consulting Australia Pty Ltd
Date:	12 October 2021	Ref:	680.30093.00000-M01-v1.0-20211012.docx
Subject:	Fill Characterisation Extractive Mining Pits - MA24585 and MA24642		

CONFIDENTIALITY

This document is confidential and may contain legally privileged information. If you are not a named or authorised recipient you must not read, copy, distribute or act in reliance on it. If you have received this document in error, please telephone our operator immediately and return the document by mail.

1 Introduction

SLR Consulting Australia Pty Ltd (SLR) were commissioned to assess the contamination status of soil/gravel proposed to be used as backfill material for the sewer headworks upgrade project at the John Stokes Square Redevelopment site located at 47 Progress Drive, Nightcliff, Northern Territory (NT).

1.1 Background

Information provided by Mousellis & Sons Pty Ltd (Mousellis) indicated that the material proposed to be used as backfill is from two different sources:

1. Virgin excavated natural material (VENM) from the extractive mining pits operating under licences MA24585 and MA24642.

2. Screened stockpiled soil that had been excavated from other construction worksites within Darwin. Based on the information provided by Mousellis, the soil was not sourced from sites operated by the Department of Defence, Airports and/or other sites where current and historical use of firefighting foam had occurred (i.e. sites typically associated with having a high potential of containing PFAS chemicals).

1.2 Objective

The objective of this assessment is to characterise the contamination status of the soil that is being proposed to backfill excavations at the John Stokes Square Redevelopment site as part of the sewer headworks upgrade project.

1.3 Scope of Works

The following scope of works were undertaken to meet the aforementioned objective.

- SLR mobilised a suitably experienced environmental consultant to collect representative soil samples from the material proposed to be used at the John Stokes Square Redevelopment site. At the time of sampling, the stockpiled material was located at the Mousellis Depot, 16 Willes Road, Berrimah, NT.

- A total of 13 soil samples were collected from the stockpiled material to adequately characterise the soil proposed to be used at the John Stokes Square Redevelopment site. Sampling rate adopted is in accordance with the National Environment Protection (Assessment of Site Contamination) Measure 1999, revised 2013 (ASC NEPM 2013) - Schedule B2 Guideline on Site Characterisation, and equates to at least one sample per 25 m^3 of soil material with a minimum of three samples collected from each stockpile.
- Samples were submitted and analysed for contaminants of potential concern (COPCs) at a National Association of Testing Authorities (NATA) accredited laboratory. COPCs were deemed to be:
  - Total Recoverable Hydrocarbons (TRH).
  - Benzene, toluene, ethylbenzene, xylene and naphthalene (BTEXN).
  - Polycyclic aromatic hydrocarbons (PAHs).
  - Total polychlorinated biphenyls (PCBs).
  - Organochlorine and organophosphorus pesticides (OCPs/OPPs).
  - Metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc, and mercury).
  - Phenoxyacid herbicides.
- SLR reviewed the asbestos analytical results provided by the Client (Greencap Pty Ltd, report reference: NT85146).
- Assess the analytical results against the screening criteria specified in the ASC NEPM 2013 guidelines and New South Wales (NSW) Environment Protection Authority (EPA) Resource Recovery Order under Part 9, Clause 93 of the Protection of the Environment Operations (Waste) Regulation 2014, The excavated natural material order 2014 (NSW EPA 2014).
- Preparation of this report.

1.4 Limitations

The following information will assist in understanding the uncertainties relating to the interpretation of the data obtained during this investigation and the recommendations presented in the report and help with assessment and interpretation of the report.

SLR assumes no responsibility for the quality or accuracy of data obtained from external sources, or for occurrences outside the scope of works defined in this report.

All work conducted, and reports produced by SLR are prepared for a particular Client's objective and are based on a specific scope, conditions and limitations, as agreed upon between SLR and the Client. Information and/or report(s) prepared by SLR may therefore not be suitable for any use other than the intended objective.

Before passing on to a third party any information and/or report(s) prepared by SLR, the Client is to inform fully the third party of the objective and scope, and all limitations and conditions, including any other relevant information which applies to the information and/or report(s) prepared by SLR.

It is the responsibility of third parties to investigate fully to their satisfaction if any information and/or report(s) prepared by SLR, is suitable for a specific objective.

Services were conducted in a conscientious and professional manner. The nature of the task, however, and the likely disproportion between any damage or loss which might arise from the work and any report prepared as a result and the cost of our services is such that SLR cannot guarantee that all issues of concern/contamination have been identified.

The report(s) and/or information produced by SLR should not be reproduced and/or presented/reviewed except in full.

2 Methodology

Works undertaken were completed in general accordance with the following guidelines and standards.

- National Environment Protection Council (1999, 2013 revision), National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM 2013).
- Standards Australia AS 4482.1-2005, Guide to the Sampling and Investigation of Potentially Contaminated Soil. Part 1: Non-volatile and semi-volatile compounds (AS4482.1-2005).
- NSW EPA Resource Recovery Order under Part 9, Clause 93 of the Protection of the Environment Operations (Waste) Regulation 2014, The excavated natural material order 2014 (NSW EPA 2014).
- NT EPA Contaminated Land Guidelines 2017.

In addition, SLR's Standard Operating Procedures (SOPs) were followed to ensure integrity was maintained and sampling procedures were completed in general accordance with the relevant guidelines and standards.

2.1 Soil Sampling Methodology

Soil samples were collected in accordance with the methodology outlined below in Table 1.

Table 1 Summary of soil sampling methodology

Activity	Detail / Comment
Soil sampling	Sample collection was undertaken in general accordance with AS4482.1-2005. Samples were collected in a three-dimensional systematic grid sampling pattern across the stockpile to account for spatial variability. Representative samples were collected from stockpiled material to provide an indication of contamination status. Samples were collected from a least 0.3m below the surface of the stockpile. Samples were collected directly from the stockpiled material by hand (clean nitrile gloves were used for each sample collected) and placed in laboratory supplied sample containers. Environmental samples were collected and handled by an experienced SLR environmental consultant.
Sample preservation	Samples were placed in laboratory supplied jars and bags and were stored as close to 4°C as practicable, in insulated chilled containers while onsite and in transit to the laboratory.
Sample submission	Chain of Custody (COC) documentation were completed at the time of sample collection and accompanied the samples to the laboratory.

Activity	Detail / Comment
Sample analysis	All samples were submitted to a NATA accredited laboratory, ALS Pty Ltd (ALS), and were analysed for the following COPCs. • TRH • BTEXN • OCPs/OPPs • PCBs • PAHs • Metals (arsenic, cadmium, chromium, copper, lead, nickel, zinc, and mercury) • Phenoxy acetic acid herbicides. Samples collected for asbestos analysis were submitted to the Greencap Pty Ltd (Greencap) laboratory, which is NATA accredited for this analysis.

2.2 Nominated Investigation Levels

The nominated investigation levels (ILs) adopted for this assessment included the following.

- ASC NEPM 2013 human health based ILs and human health screening levels specified for residential land use scenarios (HBIL/HSL-A).
- ASC NEPM 2013 ecological ILs and screening levels specified for urban residential and open space land use scenarios (EIL/ESL - URPOS).
- NSW EPA 2014 maximum average and absolute maximum concentrations specified for excavated natural material.

3 Summary of Results

A total of three (3) stockpiles were sampled as part of these works - Stockpile A (approximately 14 m^3), Stockpile B (approximately 25 m^3) and Stockpile C (approximately 56 m^3). Details of these stockpiles are provided below.

- Stockpiles A and B comprise of VENM sourced from extractive mining pits operating under licences MA24585 and MA24642. Stockpiles A and B can be described as red-orange, silty/clayey sandy gravel, where the sandy component was well sorted, and gravel was angular.
- Stockpile C was a mixture of gravel and soil sourced from different worksites operated by Mousellis. Stockpile C is similar to Stockpiles A and B with the addition of "blue metal" gravel. One piece of nylon rope and one piece of reinforced steel ("reo") was noted in this stockpile.

A visual inspection of all three stockpiles did not find any evidence of visible asbestos containing material (ACM), odours and/or stains.

The number of soil samples collected by SLR from each stockpile is listed below.

- Stockpile A – three (3) samples.
- Stockpile B – three (3) samples.
- Stockpile C – seven (7) samples.

A third party collected 16 soil samples for the purpose of investigating asbestos impact.

Laboratory certificates are included in Attachment A. Table 2 below provides a summary of the analytical soil results with respect to the detected analytes and the corresponding nominated ILs.

Table 2 Summary of laboratory results

Analyte	Unit	IL (NSW EPA 2014 VENM)		IL (ASC NEPM 2013)		Range		Samples exceeding IL
		Max. Ave	Abs. Max.	HBIL/HSL – A	EIL/ESL – URPOS	Stockpiles A & B	Stockpile C	
Arsenic	mg/kg	20	40	100	100	<5 – 7	7 – 8	None
Cadmium	mg/kg	0.5	1	20	NA	<1	<1	None
Total chromium (III+VI)	mg/kg	75	150	100 (VI only)	190 (III)	18 - 55	37 – 67	None

TPH C10-C14	mg/kg	NA	NA	NA	NA	<50	<50	None
TRH F2 – TRH C10 – C16	mg/kg	NA	NA	NA	120	<50	<50	None
TRH F2 – TRH C10-C16 minus naphthalene	mg/kg	NA	NA	110	NA	<50	<50	None
TPH C15-C28	mg/kg	NA	NA	NA	NA	<100	<100	None
TRH F3 – C16-C34	mg/kg	NA	NA	NA	300	<100	<100	None
TPH C29-C36	mg/kg	NA	NA	NA	NA	<100	<100	None
TRH F4 – C34-C40	mg/kg	NA	NA	NA	2800	<50	<50	None
TPH C10-C36 (Total)	mg/kg	250	500	NA	NA	<50	<50	None
Benzene	mg/kg	NA	0.5	0.5	50	<0.2	<0.2	None
Ethylbenzene	mg/kg	NA	65	55	70	<0.5	<0.5	None
Toluene	mg/kg	NA	25	160	85	<0.5	<0.5	None
Xylene Total	mg/kg	NA	15	40	105	<0.5	<0.5	None
Phenoxy Acetic Acid Herbicides	mg/kg	NA	NA	Various	NA	Non-detect	Non-detect	None

In addition to the analytical results summarised in Table 2 and included in Attachment A, a review of the Greencap analytical report found that asbestos was not detected in any of the 16 soil samples collected and submitted for analysis. The Greencap analytical report is also included in Attachment A.

4 Conclusion

Based on the analytical results obtained, SLR is of the opinion that the contamination status of the stockpiles sampled would not prevent them being used as backfill material for the sewer headworks upgrade project at the John Stokes Square Redevelopment site located at 47 Progress Drive, Nightcliff, NT.

SLR is also of the opinion that the material sourced from extractive mining pits operating under licences MA24585 and MA24642, meets the soil quality requirements required to be classified as VENM.

5 Further Communication

Should you have any queries relating the any of the above information, please do not hesitate to contact myself on 0435 359 720.

Yours sincerely

Julie McDowell

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample(s) requiring volatile organic compound analysis received in airtight containers (ZHE).**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP202: Particular samples required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- EP202: Poor matrix spike recoveries for Clopyralid due to matrix effects.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP068: Positive results have been confirmed by re-extraction and re-analysis.

Address	: Unit 5 21 Parap Rd PARAP 0820	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: 680.30093 John Stokes Square Sewage Eastment (LOT 9017)	Date Samples Received	: 28-Sep-2021
Order number	: ----	Date Analysis Commenced	: 28-Sep-2021
C-O-C number	: ----	Issue Date	: 29-Sep-2021
Sampler	: JAMES MURDOCH		
Site	: ----		
Quote number	: EN/032/20 Primary Work Only		
No. of samples received	: 13		
No. of samples analysed	: 13		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2134625**	Page	: 1 of 8
Client	: **SLR Consulting Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: JULIE McDOWELL	Telephone	: +61 2 8784 8555
Project	: 680.30093 John Stokes Square Sewage Eastment (LOT 9017)	Date Samples Received	: 28-Sep-2021
Site	: ----	Issue Date	: 29-Sep-2021
Sampler	: JAMES MURDOCH	No. of samples received	: 13
Order number	: ----	No. of samples analysed	: 13

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP202A: Phenoxyacetic Acid Herbicides by LCMS	ES2134625--002	STP-A.2	**Clopyralid**	1702-17-6	24.7 %	49.0-149%	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.
Phenoxyacetic Acid Herbicides (LCMS - Standard DL)	EP202	SOIL	In house: LCMS (Electrospray in negative mode). Residues of acid herbicides are extracted from soil samples under the alkaline condition. An aliquot of the alkaline aqueous phase is taken and acidified before a SPE cleanup. After eluting off from the SPE cartridge, residues of acid herbicides are dissolved in HPLC mobile phase prior to instrument analysis.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Extraction for Phenoxy Acid Herbicides in Soils.	EP202-PR	SOIL	In-House: Alkaline extract followed by SPE clean up of acidified portion of the sample extract.

Preparation Methods	Method	Matrix	Method Descriptions
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

Dear John,

Re: Asbestos Identification Analysis - 400m3 Stockpile

This letter presents the results of asbestos fibre identification analysis performed on 16 samples as received by Greencap on Friday, 17 September 2021. The samples were stated to be from 400m3 Stockpile.

All sample analysis was performed using polarised light microscopy, including dispersion staining and trace analysis in our Darwin Laboratory by the method of Australian Standard AS4964-2004 and supplementary work instruction in house method LAB04 Asbestos Identification by PLM. Any and all services carried out by Greencap for the Client are subject to the Terms and Conditions listed on the Greencap website at https://www.greencap.com.au/terms-conditions and are governed by our statements of limitation available at https://www.greencap.com.au/statements-limitation .

The analysis was completed on Tuesday, 21 September 2021.

The samples will be kept for three months and then disposed of, unless otherwise directed.

The results of the asbestos identification analysis are presented in the appended table. Accreditation covers testing activities only, sampling activity is outside the scope of ISO 17025 accreditation. Results relate only to the items tested and are for the sole use by the client.

Should you require further information please contact our Darwin laboratory.

Yours sincerely,
Greencap

*** Shaded row with bolded text indicates sample contains a positive Analysis Result for asbestos.**
If Synthetic Mineral Fibre and Organic Fibre are not stated in Analysis Results, it implies not detected.

PLEASE NOTE The samples in this report are 'As Received'. Greencap does not take responsibility for the sampling procedure or accuracy of the sample location descriptions which have been provided by the client.

NOTE 1 The reporting limit for this non-homogeneous analysis is 0.1g/kg (0.01%). The above result can be interpreted that the sample contains no detectable 'respirable' asbestos fibres (AS4964-2004 Clause 9.5).

NOTE 2 Soil analysis conducted in accordance with WA Guidelines for the assessment, remediation and management of asbestos-contaminated sites (May 2009), Recommended procedures for laboratory analysis of asbestos in soil (June 2011) and NEPM Schedule B1: Guideline on investigation levels for soil & groundwater, Schedule B2: Guideline on site characterisation.
Recommendation of minimum 500mL sample have been analysed as per NEPM Guideline.
Results denoted with * is outside our scope of accreditation.

Client and Consultant Correspondence

AUSTRALIAN
ENVIRONMENTAL AUDITORS

AEA Ref: EA0729-C1 16 March 2020

Ms Sinead Redmond
Project Management Lead, HK Solutions
On behalf of Department of Infrastructure, Planning and Logistics

Email: sinead.redmond@hksolutions.com.au

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

The following documents were reviewed:

- Agon Environmental (29 February 2020) Detailed Site Investigation, John Stokes Square, 47 Progress Drive, Nightcliff (ref. JF1006.DSI)

This letter details the main areas of works that require additional information or clarification. There will likely be additional minor editorial comments to be provided at a later date, however these items were considered a priority.

1) Source of ACM and AF/FA
   a) Previous discussions identified the source of the ACM to be formwork from the building foundations. Greencap report identified that this was not likely to be source as ACM was not observed adhered to the concrete. During inspection of the concrete stockpiles, was ACM observed adhering to the concrete?
   b) Testpits located away from the buildings also contaminated ACM. Is it possible that the ACM is from both imported contaminated fill and formwork from the building foundations?
   c) AF/FA has been identified by Greencap in the soil across the site. A review of the data has found that almost all samples were identified by the laboratory to be weathered cement sheeting, including >7mm, 2-7mm, and <2mm. Two samples of vinyl tiles were also identified. No other asbestos fines or fibrous asbestos has been identified in the laboratory reports; therefore the source of the asbestos is likely to be weathered and degraded ACM.
2) Appendix A1:
   a) The Greencap asbestos in soil calculations were done using a variety of 30%, 80% and 100% asbestos content, though no justification was given other than "based on laboratory assessment" though the laboratory certificates do not mention anything about asbestos content. The standard asbestos content for fibre cement is 15%. When the Greencap data is adjusted to reflect the standard 15% asbestos content (and 25% for vinyl tile as per Health and Safety Executive 'Asbestos: The survey guide, HSG264) only 1 sample exceeds the relevant criteria for AF (TP20, 0.0047%w/w). However, ACM was found in the following test pit logs but was not analysed at the laboratory or

reported as containing asbestos in the text of the report (TP36, TP46, TP55 and TP57) and may therefore also contain asbestos exceeding allowable levels. These areas will require inspection during civil works and then addressed under the unexpected finds process in the CEMP.

3) Section 9.5.1 (asbestos in soil remediation works)
   a) Please identify the 'three locations containing friable asbestos materials' that were disposed to landfill as asbestos contaminated waste, show on a figure, provide volume of soil disposed from each location, landfill dockets and observations during remediation (i.e. was there anything unique about this area or material to explain the contamination?).
   b) Please provide details of the lateral and vertical validation sampling or multiple lines of evidence justifying why this was not considered necessary.
4) Section 9.5.1 (Concrete crushing works)
   a) Please provide details of the segregation and clearance process of the material prior to crushing. For example, were only solid pieces of concrete crushed or were smaller pieces also crushed.
   b) Previous discussions identified old ACM formwork as a source of the ACM contamination of the site. What was done to ensure this material was not crushed or damaged in the mechanical sieve?
   c) Following crushing, the material was stockpiled and sampled. Please provide details of the volumes involved and sampling rates to assess if the sampling density met WA DoH validation density (1 per $70m^3$). Please provide details of the stockpiling and sampling methods to assess if representative samples were collected.
   d) 4 of 67 samples reportedly failed validation sampling. Was this material unique in any way? How was this material kept separate to avoid cross contamination? Please provide the calculation methodology for the samples 'Stockpile 2 Validation 17/10'
   e) The crushed concrete that passed validation sampling was reused in the commercial area. Was this material inspected when spread across the commercial area and if so, can a clearance certificate be provided?
   f) Where were the four uncrushed concrete stockpiles located and was the ground surface validated after their removal?
   g) Where was the mechanical sieve, concrete crusher and stockpiles located and has the ground surface been validated?
5) Road and reserve sampling
   a) Please clarify the extent of the road and reserve and area to be handed back to council. For example, does it include the substation, pedestrian areas, car park in the south west corner, etc. Showing the boundaries of this area on a figure with the sampling locations would assist.
   b) A high density of sampling has been undertaken across the site, but this has focused on areas outside of the road and road reserve with no samples collected from the road. Samples from within the road reserve (TP54) and immediately adjacent (TP39, TP40, TP42, TP43) have identified ACM, though all below acceptable levels. Therefore, if this area is to be handed back to City of Darwin unencumbered, it will require close supervision of civil works (down to natural soils) by a suitably qualified asbestos specialist and remediation and validation when asbestos is identified. The remediation will need to also remove locations of previously identified ACM.
   c) The proposed use of an asbestos unexpected finds protocol within a CEMP may be effective in meeting the previous point provided there is sufficient close supervision of civil works by a suitably qualified asbestos specialist to identify when ACM is observed. A copy of this protocol will need to be provided for review.
   d) If the above strategy is implemented successfully, it may be sufficient to ensure the area is free of known ACM and suitable for the proposed use without a post audit management plan or condition requiring the area capped. However, the only way to guarantee the area is completely free of ACM is for all fill materials to be removed, but I do not require this.
6) ACM has been identified in multiple locations across the site both on the surface and within the fill material. The ACM appears to be weathered, resulting in smaller fragments of ACM and release of

asbestos fibres. Over time, the ACM will continue to weather and potentially result in concentrations above allowance levels. As a precautionary measure, all areas not subject to the close supervision as per item 5c will need to be capped (i.e. permanent hardstand such as paving or building or cleanfill layer) or the fill removed.

7) As there is potential for ACM to be present within the fill across the site, a simple procedure will also be required during occupancy to identify the potential for encountering ACM when undertaking excavation works and what to do if asbestos is encountered. This would be written as a condition or recommendation in the audit report and audit statement rather than a management plan.

Please contact me if you have any questions regarding this letter.

Regards,

Australian Environmental Auditors

Jean Paul Pearce

EPA Appointed Environmental Auditor (Contaminated Land)

AUSTRALIAN
ENVIRONMENTAL AUDITORS

AEA Ref: EA0729-C2 24 April 2020

Ms Sinead Redmond
Project Management Lead, HK Solutions
On behalf of Department of Infrastructure, Planning and Logistics

Email: sinead.redmond@hksolutions.com.au

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I previously approved a strategy regarding the management of the construction works on Lot A (the police stations site). Following discussions with DIPL we understand that due to the identification of geotechnically unsuitable material during excavations and with the aim of further reducing the level of residual contamination, the proposed strategy has changed. I am supportive of undertaking additional works which will result in a lower level of long term risk to the community.

The following documents were reviewed:

- SLR (22 April 2020) Memorandum: Remediation Strategy, John Stokes Square – Lot A (ref. 680.30002.00000 Remediation Strategy 20200422.docx); and
- Email from SLR (23 April 2020) proposing changes to the sampling strategy due to material types being observed onsite and changes to the depth of excavation.

I provide the following comments:

1. General. Please note that weathered ACM and AF/FA has been identified in previous investigations at the site. How will this material be identified and managed, including risks to onsite workers and if mechanical screening is being used?
2. Section 5.2: Please provide additional detail on the proposed site supervision and how this ties into the objectives of the works. For example, if the objective is to ensure the fill is as completely free of asbestos as possible, then a higher level of supervision would be necessary than if the objective is to remove geotechnically unsuitable material and any asbestos observed with risks from any residual asbestos observed managed via capping, etc.
3. Section 5.3, Table 2:
   a) The sampling density is supported, but please note that EPA Publication IWRG702 also supports lower sampling densities in some circumstances.
   b) Please verify what 'substantial variability' means in terms of decision making on additional analysis.
   c) Where possible, please track and incorporate existing insitu data or include justification why this is not proposed.

d) Is it proposed to sample the existing crushed concrete? If not, it is recommended that some sampling for asbestos would be beneficial to verify the material is free of asbestos as previously reported.
e) Presume that standard NEPM/AS4482.1 QA/QC requirements will be complied with (i.e. duplicate sampling, etc).

4. Section 5.4. Will a broader analyte suite be necessary to facilitate waste classification and offsite disposal? Based on previous sampling, asbestos and OCPs are the key contaminants of concern and any further reduction in analysis should not apply to these contaminants.
5. Section 5.5. Please specify the criteria for ACM (this is specific to land use) and AF/FA.
6. Section 5.6. Please provide additional details regarding the airborne asbestos fibre monitoring such as the locations of monitors, duration of monitoring per day and flow rates to ensure compliance with NOHSC method, and whether personal or static.
7. If static monitoring at site boundaries, then it should be compliant with the DoH public health criteria of 0.01 f/mL.
8. How will the decision regarding material reuse on-site/reuse off-site/disposal be reported?
9. Will the footprint of the stockpile locations be validated?

Please contact me if you have any questions regarding this letter.

Regards,

Australian Environmental Auditors

Jean Paul Pearce

EPA Appointed Environmental Auditor (Contaminated Land)

AUSTRALIAN
ENVIRONMENTAL AUDITORS

AEA Ref: EA0729-C3 27 May 2020

Ms Sinead Redmond
Project Management Lead, HK Solutions
On behalf of Department of Infrastructure, Planning and Logistics

Email: sinead.redmond@hksolutions.com.au

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the proposed remediation strategy for the management of the remediation and construction works on Lot B1, B2 and B3 (the residential sites). Following discussions with DIPL we understand that due to the identification of geotechnically unsuitable material during excavations on the commercial lot (Lot A), and with the aim of further reducing the level of residual contamination, the original strategy was changed. I am supportive of undertaking additional works which will result in a lower level of long-term risk to the community.

The following documents were reviewed:

- SLR (14 May 2020) Memorandum: Remediation Strategy, John Stokes Square – Residential Lots (Lots B1, B2 and B3) (ref. Appendix J - DRAFT Remediation Strategy.docx); and
- Halikos Construction (May 2020) Construction Environmental Management Plan Revision 2.0, John Stokes Square, Broad Scale Site Remediation and Construction Preparation Works (ref. Broad Scale Remediation).

I provide the following comments:

Remediation Strategy

1. Section 1, last paragraph. The Agon reports have been reviewed and considered reliable with a note that we are resolving a minor issue regarding the crushed concrete stockpile sampling, reuse and disposal
2. Section 4. Please include NT EPA publications
3. Section 5.1,
   a) Paragraph 2. It should be noted that there is an increased risk of ACM in this material.
   b) Will SLR be inspecting the oversize screened material for ACM?
   c) Tracking of material should be documented and reported by SLR.
   d) Final paragraph. Given the previous identification of ACM and asbestos fines, these controls should be implemented from the start unless additional justification is provided.

4. Section 5.3. As per previous advice, please provide additional detail on the proposed site supervision and how this ties into the objectives of the works. For example, if the objective is to ensure the fill is as completely free of asbestos as possible, then a higher level of supervision would be necessary than if the objective is to remove geotechnically unsuitable material and any asbestos observed with risks from any residual asbestos observed managed via capping, etc.
5. Section 5.7. Air monitoring criteria should be public health (<0.01 f/mL) as monitoring is proposed on the site boundary, the occupational criteria (<0.1 f/mL) is only appropriate for workers.
6. The reuse of soil onsite is understood to be placed down in layers for compaction purposes and each lift is to be inspected for ACM by SLR with a clearance certificate issued for each lift. If ACM is observed, it will need to be removed and validated. Please note that this was the agreed approach for the commercial area, but we understand that this was not undertaken. This process provides an important extra check for ACM and needs to be undertaken for the residential allotments.
7. How will the decision regarding material reuse on-site/reuse off-site/disposal be reported?
8. Due to current COVID-19 travel restrictions, please include photographic record of the works.
9. If unexpected contamination is identified, please call to discuss the management strategy.

Construction Environmental Management Plan (CEMP)

The CEMP details the objectives, key performance indicators and targets, and environmental management measures to be implemented during the remediation and construction works. This includes erosion and sedimentation, dust and air quality, soil, waste, and asbestos management amongst other things. It also details training, including induction training for workers.

1. Due to the presence of asbestos please ensure the site is fenced if this is not already done.
2. Please include an unexpected finds protocol.
3. Appendix I.
    a. The investigations to date have identified asbestos in soil which is understood to remain onsite. The AMP should be revised to reflect this and any other associated implications.
    b. Section 8 proposes a weekly 2 hours inspection for asbestos, this is not consistent with the remediation strategy.

Please contact me if you have any questions regarding this letter.

EPA Appointed Environmental Auditor (Contaminated Land)

AUSTRALIAN
ENVIRONMENTAL AUDITORS

AEA Ref: EA0729-C4 1 June 2020

Ms Sinead Redmond
Project Management Lead, HK Solutions
On behalf of Department of Infrastructure, Planning and Logistics

Email: sinead.redmond@hksolutions.com.au

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the proposed sampling and analysis quality plan for the road reserve and Lot C as documented in:

- SLR (22 May 2020) Sampling, Analysis and Quality Plan, Detailed Site Investigation, John Stokes Square (ref. 680.10679-R01-v2.0).

The SAQP is accepted, subject to inclusion of the following comments:

1. Section 5 states that test pits will be excavated to mechanical refusal (estimated to be approximately 1 mbgl), though Table 4 states "samples will be collected …surface, 0.5mbgl, 1.0 mbgl, and every metre thereafter until target depth, intersected groundwater or auger/excavator refusal". Please note that all sampling locations should extend a minimum of 0.5m in to natural soils;
2. Section 8.5, 3rd and 4th dot points. Please ensure ACM identified during field sieving is to be weighed to enable a concentration calculations;
3. Table 5. 1. Due to identified ACM at the site, the fill at each location should be sieved and tested for ACM. Please include pH, CEC, etc to allow for calculation of EIL/ESLs;
4. Section 10. Please include data from relevant sampling locations by Agon and Greencap; and
5. General. Please photograph each test pit and include in the report as we currently can not travel to observe the investigation works.

Please contact me if you have any questions regarding this letter.

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the following revised documents:

- SLR (3 June 2020) Memorandum: Remediation Strategy, John Stokes Square – Residential Lots (Lots B1, B2 and B3) (ref. 680.10679.00000-M04-v2.0);
- Halikos Construction (June 2020) Construction Environmental Management Plan Revision 3.0, John Stokes Square, Broad Scale Site Remediation and Construction Preparation Works (ref. Broad Scale Remediation v3.0); and
- SLR (3 June 2020) Sampling, Analysis and Quality Plan, Detailed Site Investigation, John Stokes Square (ref. 680.10679-R01-v3.0).. If no a

The above documents have been revised based on comments provided in audit review letter C3 (dated 27 May 2020) and C4 (dated 1 June 2020). The revised reports have addressed the comments and are considered acceptable with the following notes:

- SLR SAQP - Note that Figure 3 is missing and should be included when; and
- SLR SAQP – If no asbestos is observed within the fill materials, please still continue to collect a jar sample for potential asbestos analysis but hold off analysis as proposed. This will provide us the opportunity to undertake the analysis should it be necessary at a later date.

Please contact me if you have any questions regarding this letter.

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the following document:

- SLR (14 July 2020) Detailed Site Investigation, John Stokes Square Development – Road Reserve and Lot C (ref. 680.10679-R03-v1.0);

The road reserve and Lot C sampling program appears to have been implemented in accordance with the approved SAQP. I provide the following notes for inclusion in the final report:

- Appendix D – laboratory certificate of analysis are missing for samples from TP25 to TP35.
- Appendix E – Sample results are missing for TP26 from Table 1, several sample results are missing from Table 5.

In either the RAP, a revised DSI or overall completion report for the site, we will need figures and tables consolidated all of the data from the various site investigations along with details of samples characterising the final site condition upon which we will base our opinion of site suitability.

Please contact me if you have any questions regarding this letter.

Auditor Advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Sinead,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the following document:

- SLR (7 August 2020) Remediation Action Plan, John Stokes Square Redevelopment, Road Reserve and Lot C (ref. 680.10679-R04-v4.0).

The RAP was discussed at a teleconference between SLR, DIPL, HK Solutions and AEA on 17 August 2020, with further details to be provided. The RAP details the remedial strategy for the remediation of the identified 'known asbestos impact area' which covers a small portion of the overall road reserve and Lot C area. The RAP also covers the removal of services. It is understood from the teleconference that the asbestos impacted area and all services will be dug up under asbestos conditions. During removal of all existing services, the excavation trenches will be inspected to determine if any asbestos is present within the material. To ensure adequate characterisation has been achieved, the extent of the services removed will be mapped against the previous investigation locations. If there are any areas that have not been assessed, additional investigation trenches will be completed, and the material inspected. Where any asbestos is identified, this material will be removed under asbestos remediation conditions.

Our current understanding of the site is that the asbestos within the road reserve and Lot C is isolated to the known asbestos impacted area. If during the above works, asbestos is found to be more widespread, then additional remediation works would be necessary, such as the excavation and abatement/disposal of all fill materials within this area.

If further widespread asbestos is not found, then it would be appropriate to proceed with the civil works.

The civil works within the road reserve and Lot C will need to be undertaken under a Construction Environmental Management Plan (CEMP) with appropriate controls in place to protect the site workers from asbestos and unexpected finds protocol.

As discussed at the meeting, there is an element of risk to the project that some asbestos within the road reserve and Lot C may not be identified during the remedial and investigative works and that asbestos may be encountered during civil works. If asbestos is identified during civil works, it is understood that the works in that area will cease, and a suitably experienced environmental consultant/hygienist will be

engaged to advise the process. If asbestos is identified in multiple areas during civil works a strategy may need to be formulated to address the removal, such as further removal of fill materials.

A separate environmental audit report and accompanying statement/certificate will be provided for the road reserve and Lot C following completion of the civil works to allow the auditor to provide ongoing audit services in case of unexpected finds during civil works.

Please update the remediation plan to reflect the above or give us a call to discuss.

Please contact me if you have any questions regarding this letter.

Project Management Lead, HK Solutions
On behalf of Department of Infrastructure, Planning and Logistics
Email: tony.hopkinson@hksolutions.com.au

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Tony,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the following document:

- SLR (25 February 2021) Validation Report, John Stokes Square Redevelopment – Lot A (ref. 680.10679-R02-v1.0).

The report is well written and appears reliable for the work undertaken, subject to addressing the following comments:

1. Please include an executive summary.
2. When analysing soil for asbestos (AF/FA) in line with WA DoH guidelines a 500mL (minimum) sample should be provided to the laboratory analysis. It appears that this may not have always been done. Please provide lines of evidence as to why this is acceptable.
3. Previous environmental investigations have been briefly summarised. However, I need consolidated data from all investigations (where sample locations remain following remediation, including historical, validation, stockpiles, imported fill), with details of samples characterising the final site condition. It should also include a table of all suspected material remaining onsite if there is residual uncertainty - i.e. fate of some stockpiles, etc. The other areas may be able to avoid this requirement due to the extensive remediation works undertaken, but as this area has had less remediation completed, incorporation of previous environmental data may be necessary.
4. The deviations to the proposed remediation strategy identified some residual issues regarding the reuse of crushed concrete and potential reuse of impacted soil, and lack of documentation regarding the methodology of reuse or inspection. Please clarify the level of involvement by SLR. As SLR was not present during reinstatement of the screened spoil, additional information will be required by the contractor detailing the inspection and observations of potential ACM during the reinstatement of the screened material.
5. Section 4.1. Was the excavated surface still fill material or natural soil? Was the base and walls of the excavation inspected prior to backfill? Were any underground services encountered or removed and what is the likelihood of any remaining? Please provide additional detail regarding the removal and backfill of any trenches.
6. Section 4.2. Please show 'VAL-A' on a figure.

7. Section 4.3. Additional information is required to determine if the soil stockpiles that reported asbestos concentrations were reused onsite. Therefore documentation regarding any material disposed to landfill, dates and volumes of disposal and disposal dockets and a reconciliation against the impacted stockpiles and volumes would assist in determining if any impacted material was reused.
8. Section 4.3. What volume of material was imported to site?
9. Section 4.3. Imported fill was sourced from a defence site without the auditors knowledge and without the ability to conduct sampling to verify the presence/absence if PFAS contamination. Therefore the PFAS may potentially be present in this material and if the material is to be removed from the site, the material will need to be assessed as per waste characterisation requirements, though the analyte suite will need to include PFAS. The risk to human health and the environment from the PFAS is unlikely to present a risk to proposed site use.
10. Figure – please include a conceptual site model with hydrogeological cross section characterising the final site condition. Either a single plan for the entire site would be sufficient or a CSM for each area.

Please contact me if you have any questions regarding this letter.

Auditor advice
John Stokes Square Redevelopment
47 Progress Drive, Nightcliff, Northern Territory

Dear Tony,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

I have been requested to review the following revised report and spreadsheet in response to Auditor review letter C15 (dated 28 April 2021):

- SLR (24 August 2021) Validation Report, John Stokes Square Redevelopment – Lot A (ref. 680.10679-R02-v2.0); and
- Response spreadsheet (ref. 680.10679.00100-R02-v1.0 Response to Auditor Comments).

The revised report has addressed the majority of our previous comments with the following comments requiring resolution split between those applicable to SLR and those applicable to the Contractor.

Contractor

Previous Comments:

- *The deviations to the proposed remediation strategy identified some residual issues regarding the reuse of crushed concrete and potential reuse of impacted soil, and lack of documentation regarding the methodology of reuse or inspection. Please clarify the level of involvement by SLR. As SLR was not present during reinstatement of the screened spoil, additional information will be required by the contractor detailing the inspection and observations of potential ACM during the reinstatement of the screened material.*
- *Section 4.3. Additional information is required to determine if the soil stockpiles that reported asbestos concentrations were reused onsite. Therefore documentation regarding any material disposed to landfill, dates and volumes of disposal and disposal dockets and a reconciliation against the impacted stockpiles and volumes would assist in determining if any impacted material was reused.*
- *Section 4.3. What volume of material was imported to site?*

SLR has reported on items that they were involved in which is acceptable. However, we require resolution of the following from the Contractor:

1. SLR Exec Summary: *The Civil Contractor reinstated and compacted the excavated areas at the Site without the presence of a SLR Consultant as required in the remediation strategy. Subsequently visual clearance of the surface of each compacted lift during reinstatement of the excavated areas could not be provided.* Did the contractor observe any demolition waste or potential asbestos containing material during their works that were not subsequently removed and how attentive was the contractor during this process?
2. SLR Exec Summary: *Further assessment was recommended by SLR to determine if stockpiled crushed concrete could be reused onsite from a contamination perspective, or at least receive advice/endorsement from the CLA that previous investigation works conducted on this material was sufficient to enable its reuse. The material was reused at the Site without being resampled, prior to CLA advice or endorsement being received. Based on the stockpile characterisation results, SLR recommended further segregation works be undertaken for three stockpiles to ensure their suitability for reuse on Site. As SLR did not receive information from the Civil Contractor on the methodology that they used to reinstate the excavations using stockpiled spoil and/or crushed concrete, it is unclear if the recommended further segregation works were completed.* Contractor to advise if segregation occurred and the location and depth (below base on concrete slab) the material was reused.
3. Please advise of the approximate volume of imported soil from the Larrakeyah Defence Base and the location/depth used.

SLR

Previous Comment: *Section 4.1. Was the excavated surface still fill material or natural soil? Was the base and walls of the excavation inspected prior to backfill? Were any underground services encountered or removed and what is the likelihood of any remaining? Please provide additional detail regarding the removal and backfill of any trenches.* SLR Response: *The final excavation at the Site had an area of approximately 3,620 m2 and generally extended down into the natural red soils to a maximum depth of 0.3 m.*

A. Given Lot A has an area of 3,619 m^2 – the entire footprint was Lot A was excavated. Is this correct?
B. Was the entire Lot A excavated to natural or were there residual fill materials in the base and if so, did the fill materials contain asbestos or construction and demolition wastes? From our discussions with SLR, the geotechnically unsuitable fill material contained the vast majority of the asbestos and all of this fill was removed from Lot A. The final surface comprised the red natural soils which would be a combination of reworked natural and virgin natural soils with no known residual asbestos within these soils. If this is correct, please amend to provide this type of clarification within the report.
C. When the excavation face around the boundary of Lot A was inspected, were any asbestos or construction and demolition wastes observed?
D. Are there any known or potential residual underground services beneath Lot A that could contain asbestos within the fill or asbestos containing services (water pipes, Telstra pits, etc)?

SLR Exec Summary: *Due to deviations from the remediation strategy, SLR does not have sufficient evidence to provide comment on the suitability of material blended and used to backfill the excavated areas within Lot A.*

E. Please calculate the weighted average for the stockpiles assuming the material was reused onsite without removal of the asbestos to help demonstrate the quantum of risk involved for future workers.

SLR Exec Summary: *Likewise, any persons conducting future excavations at the Site (Lot A) may encounter asbestos impacted soils or fragments of ACM debris, if asbestos impacted material was used to*

backfill/reinstate excavated areas within Lot A. As a precautionary measure the following should be included in the workplans of any persons/contractor conducting excavation works at the Site (Lot A) to ensure appropriate controls are implemented in the event unexpected asbestos is encountered.

· Asbestos management plan

· Unexpected finds protocol

· Associated training.

F. Is SLR recommending an asbestos management plan for the site or for the contractor undertaken excavation works to prepare the plan for their specific works? I.e. is it a 'Site' asbestos management plan or a 'Contractor's" asbestos management plan? In your response, please advise how this aligns with WA DOH Asbestos Guidelines and WH&S requirements.

Please contact me if you have any questions regarding this letter.

DRAFT Auditor advice
John Stokes Square Redevelopment
Lot A
47 Progress Drive, Nightcliff, Northern Territory

Dear Tony,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

As part of my role as auditor, I have reviewed the characterisation, remediation and validation of Lot A (the site), being developed at John Stokes Square. Several phases of investigation were completed which identified asbestos within fill material across the site. The majority of the fill material on the site was progressively excavated, inspected during excavation for asbestos. The soil was screened and stockpiled and any material containing asbestos was to be removed from the site an accredited landfill facility. The reporting provided by SLR has left some uncertainty whether the asbestos impacted material was removed or reinstated with the validated fill material. Additionally, the reinstatement was not inspected by an environmental consultant to provide any clearance that asbestos was not placed back down onto the site. Therefore I am not able to verify if any asbestos remains at the site. However, assuming some asbestos was reinstated, I believe the risk of any human receptors being exposed to this material being is likely to be low if covered by the presence of permanent hardstand or 0.5m of verified asbestos free material. Please confirm the final built form/site coverings, clean fill thickness, etc.

Although there is no known asbestos onsite, there is the potential for residual asbestos to be present as noted above and within the SLR report. It is therefore warranted that an unexpected find protocol be implemented for any subsurface works, to say that asbestos may be encountered if digging. I will likely need to make a notation to this effect in the audit determinations/conditions.

Imported fill was sourced from a defence site without the auditors knowledge and without the ability to conduct verification sampling to determine if PFAS was present, acknowledging the waste classification report noted that known PFAS contamination was segregated. Therefore, PFAS may potentially be present in this material, but at levels that are unlikely to present a risk to human health or the environment at the site. As the imported fill may contain PFAS, any soil removed from this portion of the site may need to include PFAS within the waste classification sampling. This does not apply to other areas of the site (i.e. Road Reserve) unless the imported fill was reused in other areas of the site – please advise.

Regarding my determination of site suitability, I am only permitted to provide this determination within my Environmental Audit Report and accompanying Certificate or Statement of Environmental Audit. However, based on current information and subject to review of the updated SLR report, I am not aware of

contamination issues that would preclude the proposed development, subject to maintaining the surface covering noted above. Due to the uncertainty around the material reinstated following the remediation and validation activities that were completed, specifically the uncertainty around the placement of fill material potentially impacted with asbestos, the site may not be suitable for residential development without additional assessment. The need for these restrictions will be reviewed based on the updated SLR report.

Please contact me if you have any questions regarding this letter.

Regards,

Australian Environmental Auditors

Auditor advice
John Stokes Square Redevelopment
Lot A and completed portion of Road Reserve
47 Progress Drive, Nightcliff, Northern Territory

Dear Tony,

I have been commissioned to conduct an environmental audit of the abovementioned site in accordance with Section 53X of the Environment Protection Act 1970 (Vic), pursuant to Part 6 of the Northern Territory's Waste Management and Pollution Control Act.

The audit is in the process of completion with the site investigation and remediation works completed, but awaiting finalisation of your consultants reports before we can complete population of our environmental audit report and statement of environmental audit/

I understand that the police station (Lot A) and the completed northern portion of the road reserve will be utilised prior to completion of the audit. Whilst this is unusual and use is not at our risk, I consider the risk to be minimal for the following reasons:

- The site investigations have identified that the key contaminant of concern is limited to asbestos within fill materials and former underground services (pipes and pits).
- Within Lot A, the majority of the asbestos contaminated fill has been excavated and disposed of offsite. However, there is potential for asbestos to remain within residual reworked natural soils, redundant underground services, and potentially within the backfill material. Based on the environmental works undertaken during investigation and remediation of the site, the potential for residual asbestos is considered low, however as the removal of asbestos within the stockpiles can not be verified it is considered that there is potential for asbestos in the form of ACM and AF/FA to remain within soils and infrastructure onsite. The entire site is covered by concrete, as such there is no exposure risk to site users (i.e. visitors and workers) while this concrete is in place. In the event that subsurface works are required below the concrete, then controls should be implemented on the basis that the workers may encounter ACM in the soils or ACM infrastructure.
- Within the northern portion of the road reserve, all known asbestos has been excavated and disposed of offsite. We have been advised that all of the fill materials within the entire road reserve have been excavated and any identified asbestos removed from site along with removal of all asbestos underground services, with documentation to demonstrate this yet to be finalised. The potential for residual unknown asbestos is therefore considered low. The road reserve comprises bitumen road, concrete foot path and pockets of inground gardens (with at least 0.5m of clean fill present above residual soils), as such there is no exposure risk to site users (i.e. visitors and workers) while these are in place. In the event that subsurface works are required, then controls

should be implemented on the basis that the workers may encounter ACM in the soils or ACM infrastructure, until such time as the Auditor consider documentation proves that this is not necessary.

Please note that this is not a determination of site suitability, as I am only permitted to provide this determination within my Environmental Audit Report and accompanying Certificate or Statement of Environmental Audit. Rather, this is an opinion on the human health risk from site contamination.

Please contact me if you have any questions regarding this letter.

Regards,

Australian Environmental Auditors

Jean Paul Pearce

EPA Appointed Environmental Auditor (Contaminated Land)

NOTIFICATION OF REQUEST TO ISSUE A CERTIFICATE OF ENVIRONMENTAL AUDIT

21 November 2019
Manager – Environmental Audit
NT EPA
GPO Box 3675
Darwin NT 0801
c/o Christopher.coombes@nt.gov.au

I, Jean Paul Pearce, a person appointed as an environmental auditor (contaminated land) by the Environment Protection Authority under s. 53S of the *Environment Protection Act 1970* (Vic.) and in accordance with Part 6 of the Northern Territory's Waste Management and Pollution Control Act, have been requested to issue a certificate of environmental audit for the site; 47 Progress Drive, Nightcliff; Northern Territory. Details are as follows.

Auditor	Jean Paul PEARCE
Auditor account number	101292
Auditor appointment end date	26 November 2022
Auditor's appointment category	CL
Audit Type	53X (site suitability audit)
Name of person requesting audit	Ms Sinead Redmond Project Management Lead Northern Territory Department of Infrastructure, Planning and Logistics Land Development Unit sinead.redmond@hksolutions EPA customer account number (if available). – n/a
Relationship of person requesting audit to site	Authorised representative of site owner
Name of premises owner	DIPL Representative Project Manager
Date of auditor engagement	20/11/2019
Proposed completion date of the audit	1/04/2020
Reason for audit	Due to the identified pesticide and asbestos contamination, we understand EPA has required an Auditor to determine the site is suitable for use;
Audit categorisation	Risk
Environmental Segments	Air, Land, Groundwater, Surface water
If the audit was required by an EPA notice, licence or other, please provide EPA service order number	n/a
Current land use zoning	Zone MR (Medium Density Residential)
EPA Region	Darwin
Municipality	Nightcliff
Dominant Lot on title plan	Lot 9077 Town of Nightcliff
Additional Lot on title plan(s)	
Site/Premises name	John Stokes Square Nightcliff Development
Building/complex sub-unit/Lot No.	--
Street/Lot – Lower No.	47
Street/Lot – Upper No.	
Street Name	Progress,
Street type (road, court, etc)	Drive

Street suffix (North, South etc)	--
Suburb	Nightcliff
Postcode	0810
GIS Coordinate of Site centroid[1] Latitude (GDA94)	-12.388587°
Longitude (GDA94)	130.850751°
Site area (in square metres)	18,900 m^2
Plan of site/premises showing the audit site boundary attached	Yes
Plan of site/premises showing the audit site boundary attached in a spatial data format	No
Proposed support team	Shandel Coleman (internal audit support).
Is this audit report a combined audit and site assessment report?	No

In notifying NT EPA of this request to perform a Contaminated Land Audit, I state that:

- I am not aware of any conflict of interest, which would preclude me from issuing a Certificate or Statement of Environmental Audit for the above site.
- I have not had prior involvement in any assessment or clean-up works at the site, which would preclude me from issuing a Statement of Environmental Audit for the site.

Yours sincerely,

Signed: _____

Jean Paul PEARCE

13 August 2021

Jean-Paul Pearce

Contaminated Sites Auditor

Australian Environmental Auditors

Dear Jean-Paul,

RE: Inspection of John Stokes Square Development Site, 12 August 2021

The following presents a photolog and notes collected during the Site Inspection of the John Stokes Square redevelopment, on 12 August 2021, undertaken on behalf of Australian Environmental Auditors.

The inspection focussed on the non-residential areas, comprising the Police Station, Road Reserve (Open Space), and Parking Area.

POLICE STATION

The Police Station development is 99% complete, with commissioning and connection of services, and Progress Drive frontage landscaping (external to the audit area) the only outstanding works.

The entire Site is sealed, with external concrete apron surrounding the entire building within the compound, with no internal landscaping features/ exposed soils.

Plate 1 **Police Station frontage along Progress Drive, with exposed soils for frontage landscaping (understood to be external to the audit area).**

Plate 2 **Police Station frontage along Progress Drive, with sealed concrete surfaces extending south through compound along western portion.**

Plate 3 **View looking west into Police Station compound, with sealed concrete surfaces along southern portion.**

ROAD RESERVE

Key observations:

- The majority of the underground infrastructure/ services (stormwater, electrical, etc.) have been installed, with most connection points still exposed pending connections, pit/ manhole install.
- The construction of road along the eastern portion is underway, with a large portion of the ground improvement works complete in the area, and spreading and compaction of imported aggregate base course underway. Appeared significant soil removal works had occurred along the road alignment to reach design levels (with levels below the adjacent landscaping area along the eastern strip).
- Ground works, comprising excavation to box out for landscaping, is still progressing along the western portion. Inspection of a boxed out area observed:
    - A fill layer of approximately 150mm.
    - No foreign materials observed within the in-situ fill excavation side profile of the boxed out area.
    - Inspection of the boxed out spoil however identified foreign inclusions including ceramic tile, concrete fragments, bitumen fragments, PVC, and terracotta pipe.
    - A area that was being excavated at the time of inspection, connected to and extending south from the inspected boxed out area, was subject of an unexpected find (occurred immediately prior to the inspection) with numerous large fragments of cement sheet exposed/ identified from the fill layer.

Plate 4 **View looking south from Progress Drive through the Road Reserve (showing boxing out for landscaping along western verge, and aggregate base course laying along the eastern verge).**

Plate 5 **View looking north, north-east across road construction zone, and spreading/ compaction of base course underway.**

Plate 6 **Boxing out works for landscaping along western portion of Road Reserve (view looking south). Note cordoned off area associated with asbestos unexpected find.**

Plate 7 **Soil profile of boxed out area (north-west portion of Road Reserve) with approx. 150mm surface fill layer.**

Plate 8 **Spoil from boxing out landscape area, with concrete, bitumen, ceramic tile, terracotta pipe, and PVC observed foreign inclusions.**

Plate 9 **Area of unexpected find, during excavation extending south from boxed out area. The find was numerous large fragments of cement sheet (refer to next Plate).**

Plate 10 **Unexpected find, numerous large fragments of cement sheet. Unexpected Find protocols implemented including stop works, cordoning off, awaiting assessment by engaged LAA.**

Plate 11 **Reworked soil profile along western boundary of Road Reserve and the western housing development block.**

PARKING AREA

The parking area has been boxed out in preparation for the install of a large stormwater retention tank. Majority of spoil was excess to Project needs and has been disposed offsite. Reportedly the fill across this zone had largely been removed prior to Head Works, with no unexpected finds encountered, evidenced by the soil profile observed which was natural.

Plate 12 **View looking west from southern portion of Road Reserve across the Parking Area that has been boxed out in prep for the stormwater retention tank install.**

GENERAL

Discussions with DIPL Site personnel revealed around 5 to 7 asbestos related unexpected finds had occurred within the subject sites (Police Station and Road Reserve) during redevelopment works. DIPL can provide the details upon request.

For any further information, please do not hesitate to contact the undersigned on 0408 018 788 or chris.gamble@agonenviro.com.au.

Yours Sincerely,

Chris Gamble
